

SwiftUI 도전기: CLOVA Note

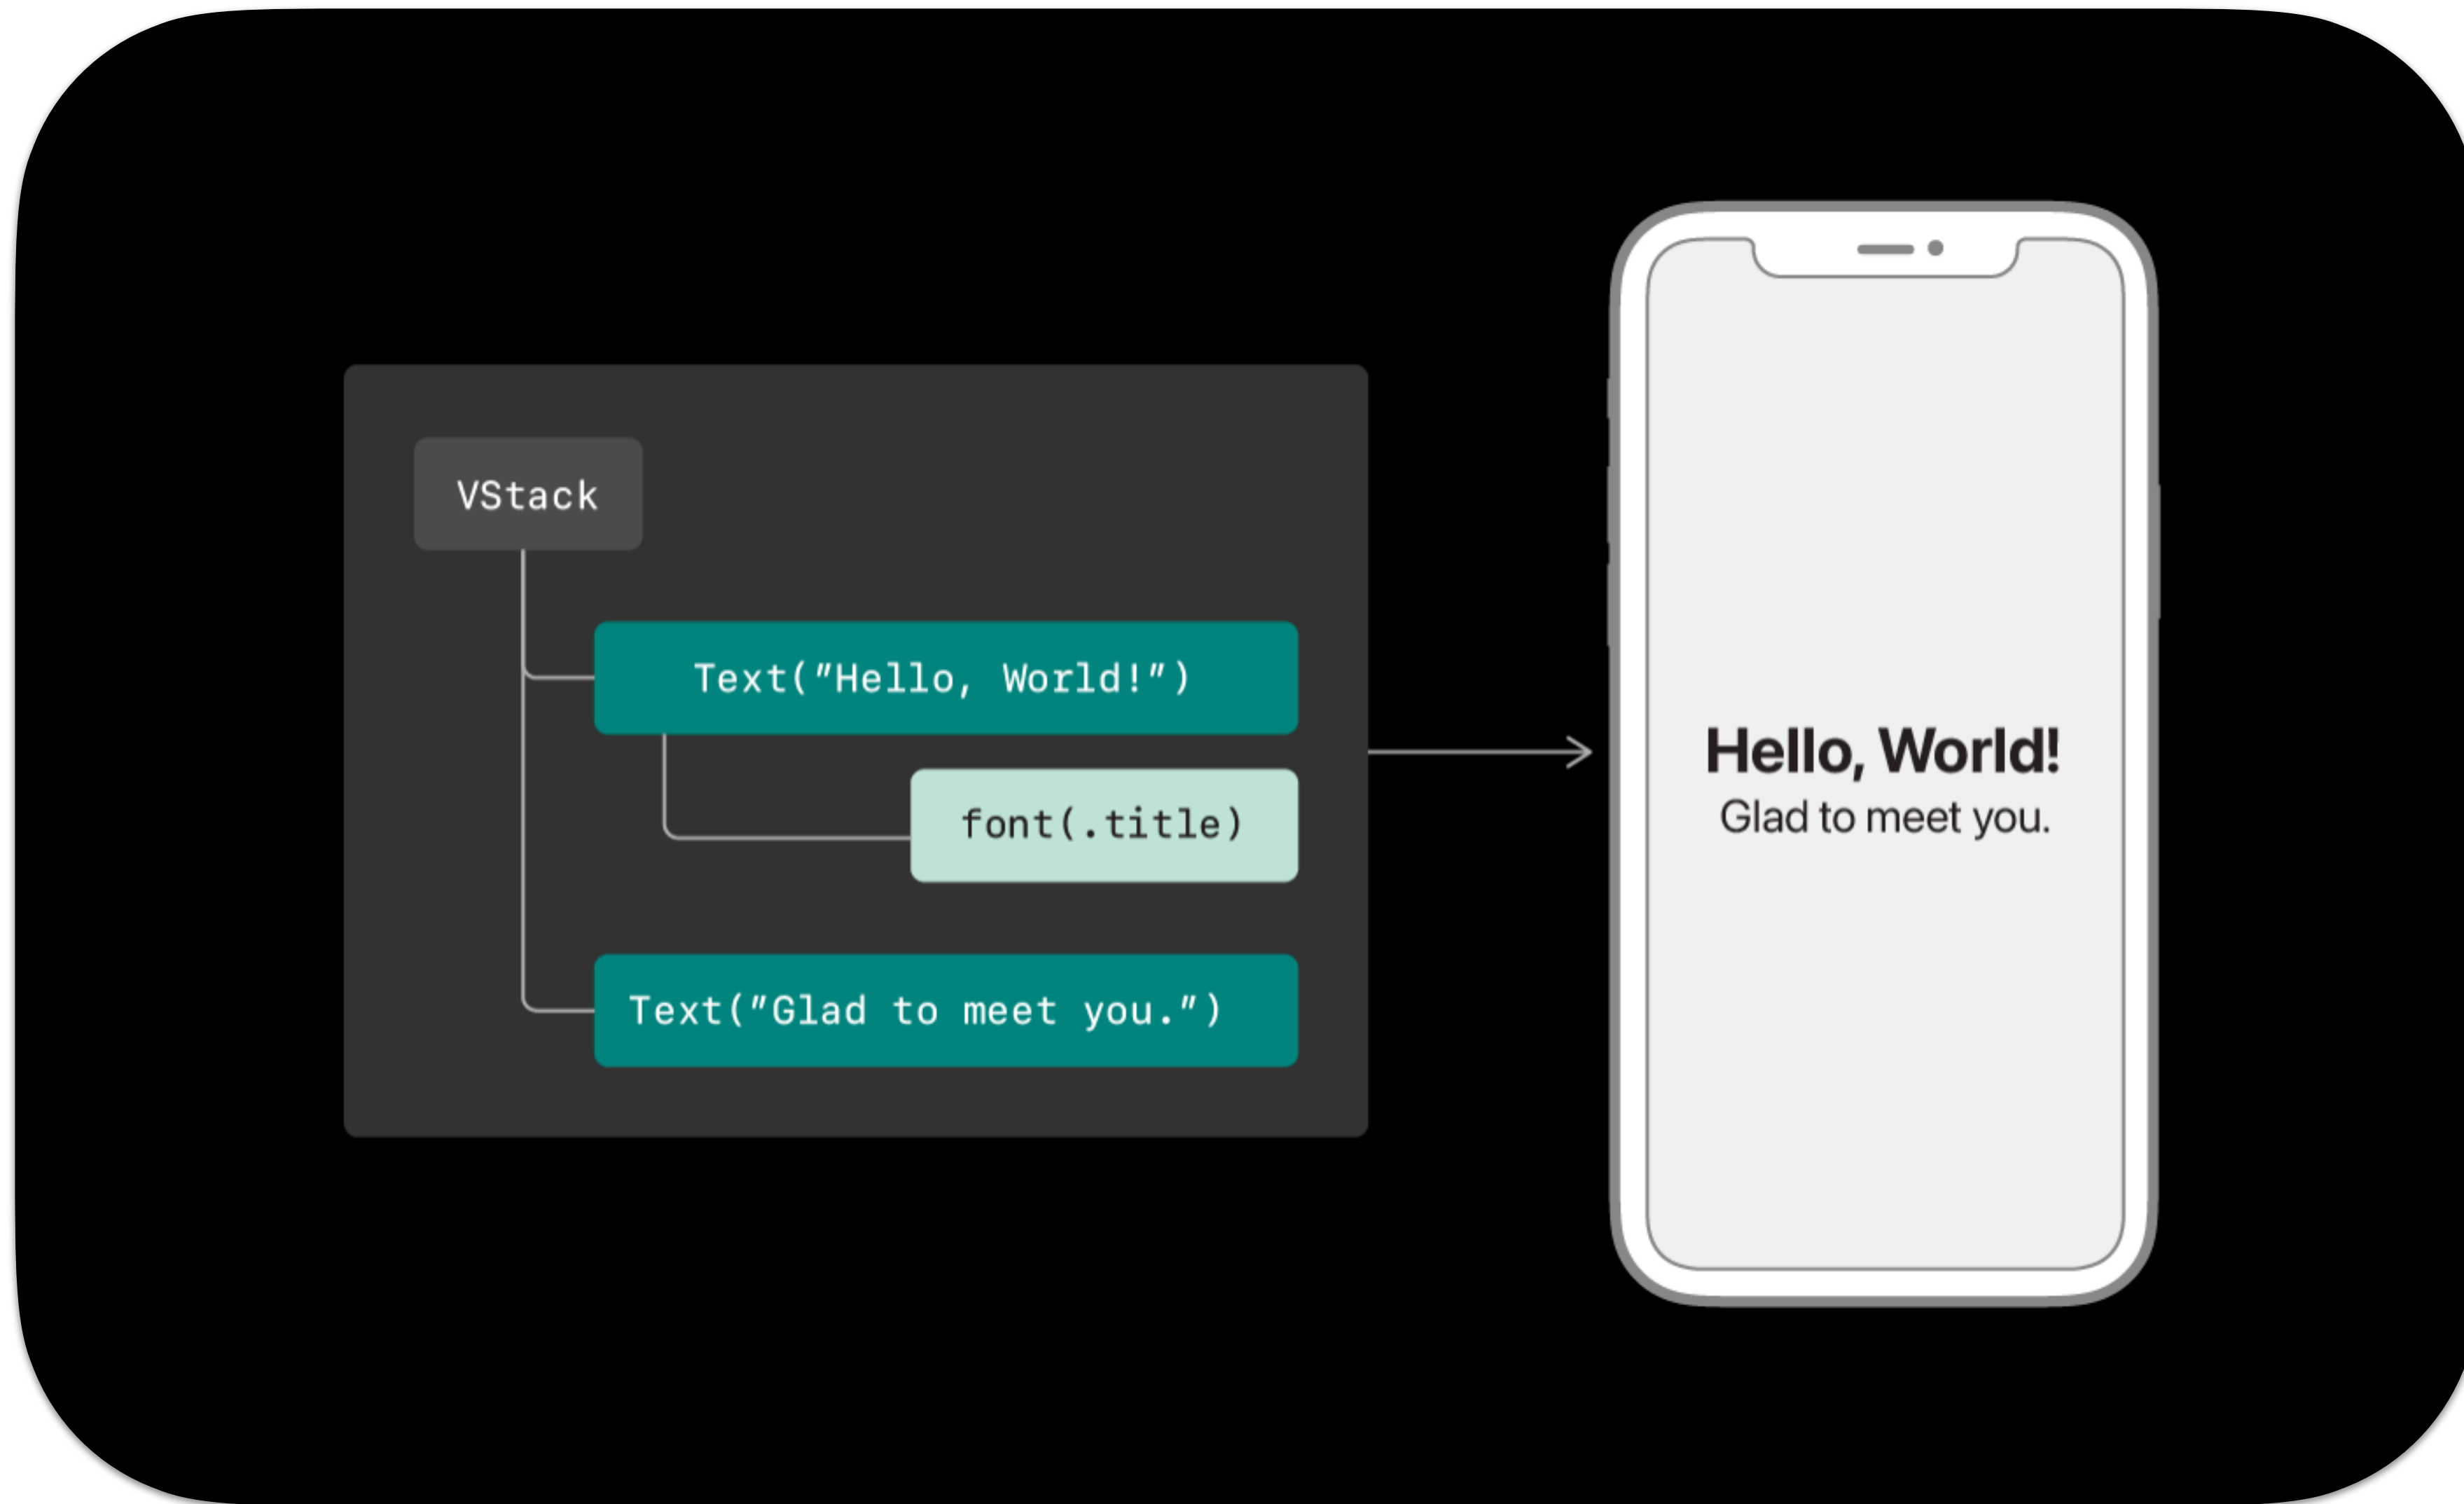

CLOVA / 손대근

SwiftUI

Declarative UI

State and Data Flow

```

class LoginView: UIView {

    private let loginButton = UIButton()

    override init(frame: CGRect) {
        super.init(frame: frame)

        loginButton.translatesAutoresizingMaskIntoConstraints = false
        loginButton.setTitle("Login", for: .normal)
        loginButton.addTarget(self, action: #selector(login), for: .touchUpInside)

        addSubview(loginButton)

        NSLayoutConstraint.activate([
            loginButton.leadingAnchor.constraint(greaterThanOrEqualTo: leadingAnchor, constant: 20),
            loginButton.trailingAnchor.constraint(lessThanOrEqualTo: trailingAnchor, constant: -20),
            loginButton.centerXAnchor.constraint(equalTo: centerXAnchor),
            loginButton.bottomAnchor.constraint(equalTo: bottomAnchor, constant: -50)
        ])
    }

    @objc private func login() {
        // login
    }

    func setLoginButton(_ enable: Bool) {
        loginButton.isEnabled = enable
    }

    required init?(coder: NSCoder) { ... }
}

```

```
struct LoginView: View {  
  
    @ObservedObject var viewModel: LoginViewModel  
  
    var body: some View {  
        VStack {  
            TextField("ID", text: $viewModel.id)  
            TextField("Password", text: $viewModel.password)  
            Spacer()  
            Button(action: {  
                viewModel.login()  
            }, label: {  
                Text("Login")  
            })  
        }  
    }  
}
```

ObservableObject

ObservedObject

Published

Make Model Data Observable

```
class Feed: ObservableObject {  
  
    @Published var title: String  
    @Published var content: String  
    @Published var isLiked: Bool  
  
    init(title: String, content: String, isLiked: Bool) { ... }  
  
    func toggleLike() { ... }  
}
```

Monitor Changes in Observable Objects

```
struct FeedView: View {  
    @ObservedObject var feed: Feed  
  
    var body: some View {  
        VStack(alignment: .leading) {  
            HStack {  
                Text(feed.title)  
                    .font(.title)  
                Image(systemName: feed.isLiked ? "hand.thumbsup.fill" : "hand.thumbsup")  
                    .onTapGesture {  
                        feed.toggleLike()  
                    }  
                Spacer()  
            }  
            Text(feed.content)  
            Spacer()  
        }  
        .padding(20)  
    }  
}
```

Feed (ObservableObject)

title	DEVIEW 2021
content	SwiftUI
isLiked	True

DEVIEW 2021

SwiftUI

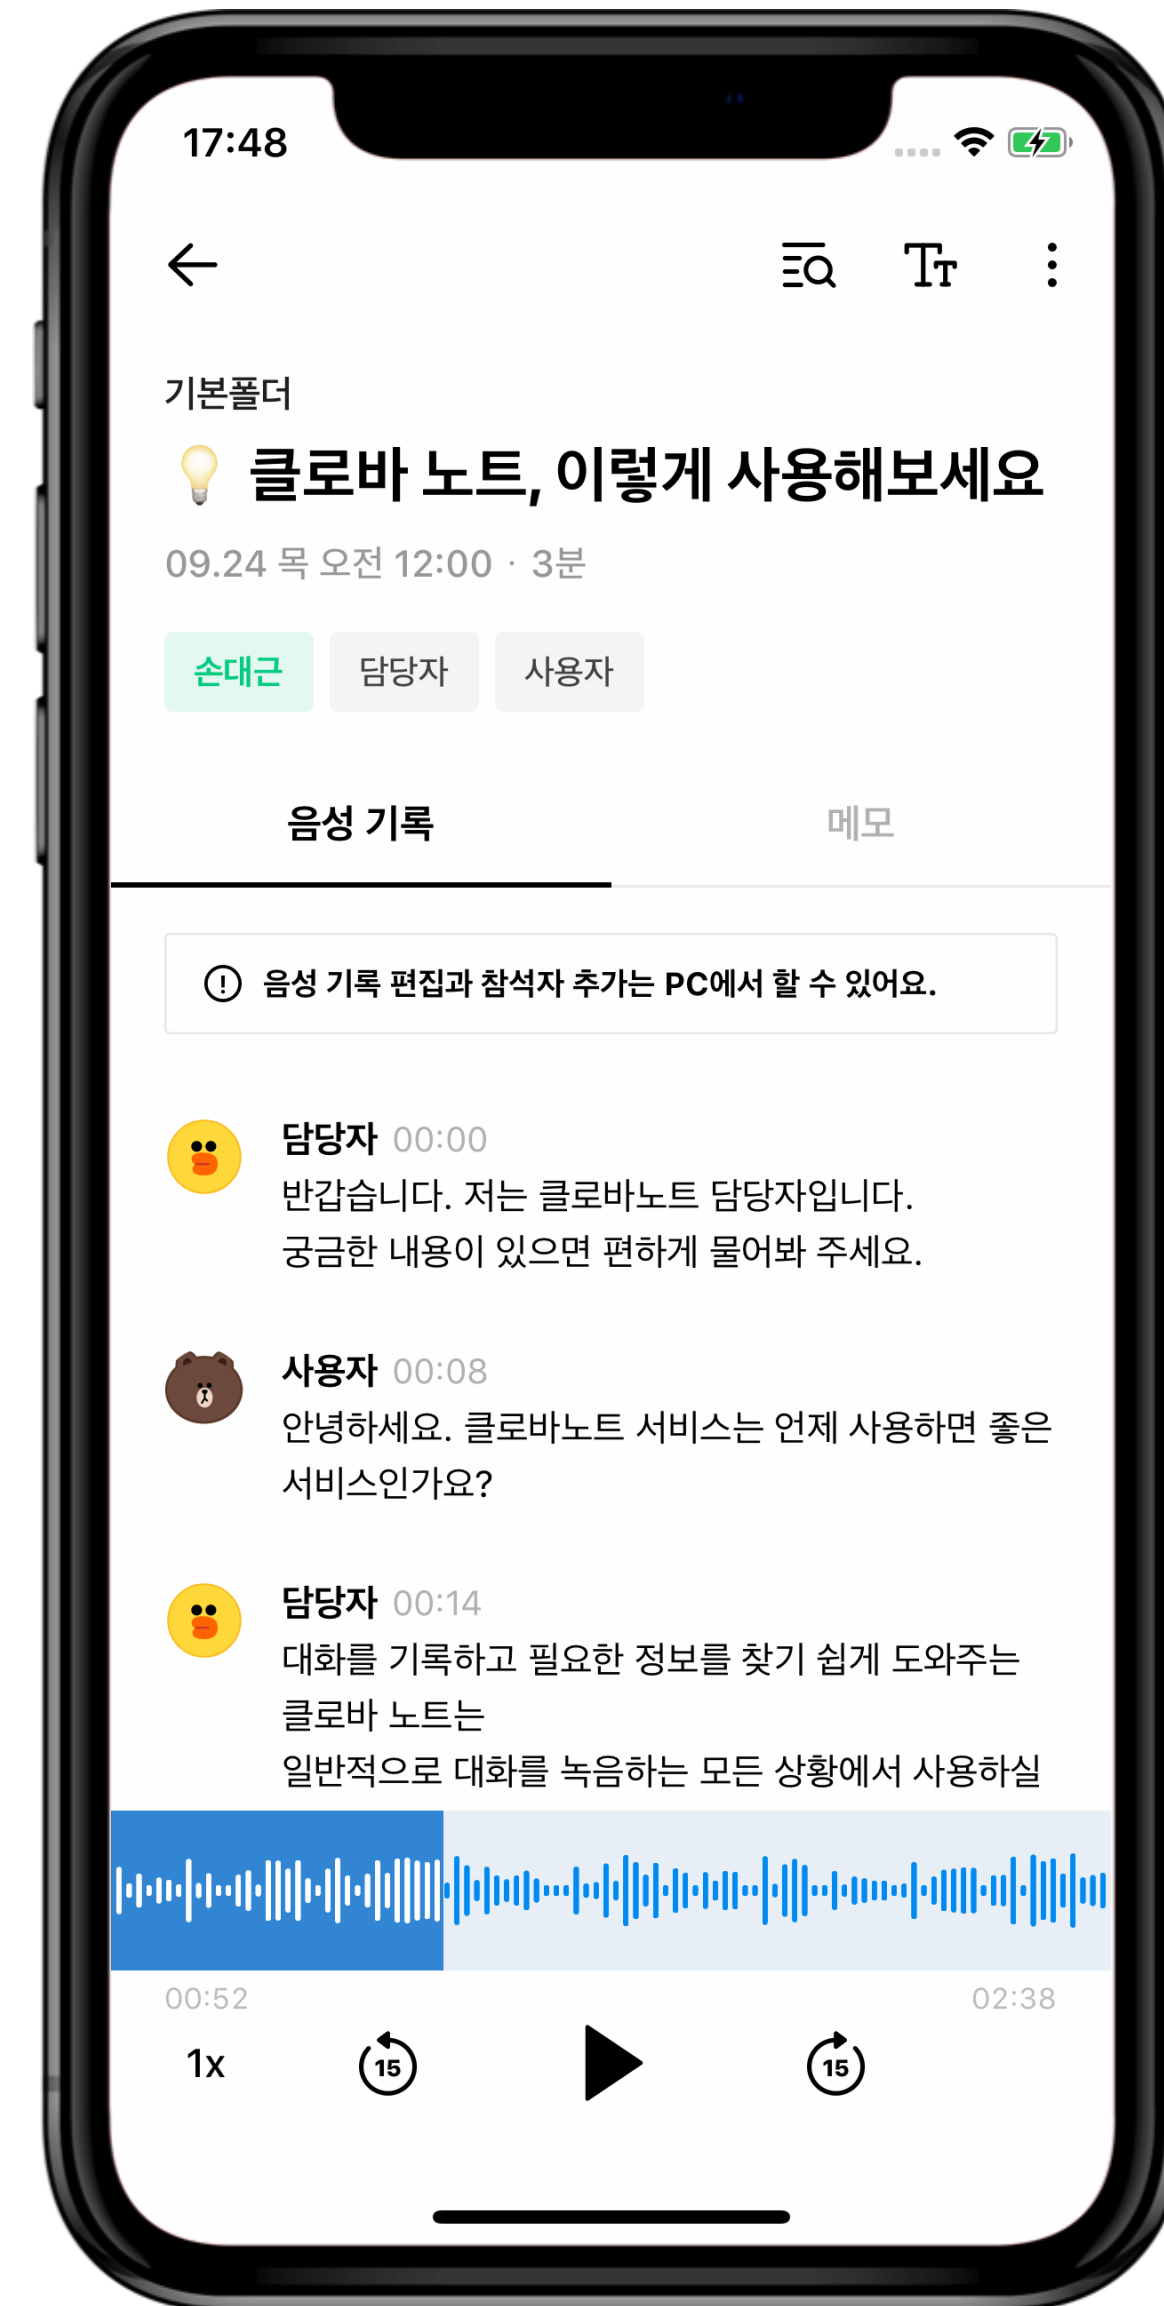

```
HStack {  
  Text(feed.title)  
    .font(.title)  
  Spacer()  
  Image(systemName: feed.isLiked ? "hand.thumbsup.fill" : "hand.thumbsup")  
    .onTapGesture {  
      feed.toggleLike()  
    }  
}
```

Benefits of SwiftUI

Productivity

Integration with UIKit, AppKit

CLOVA Note with SwiftUI

App Architecture

ViewModel

```
class NoteViewModel: ObservableObject {  
  
    @Published var title: String  
    @Published var focusedBlock: NoteScriptBlock?  
    @Published var blocks: [NoteScriptBlock] = []  
    @Published var memos: [NoteMemo] = []  
  
    init(title: String) { ... }  
  
    func updateBlock(block: NoteScriptBlock) { ... }  
  
    func updateMemo(memo: NoteMemo) { ... }  
  
    func playBlock(block: NoteScriptBlock) { ... }  
  
    // ...  
}
```

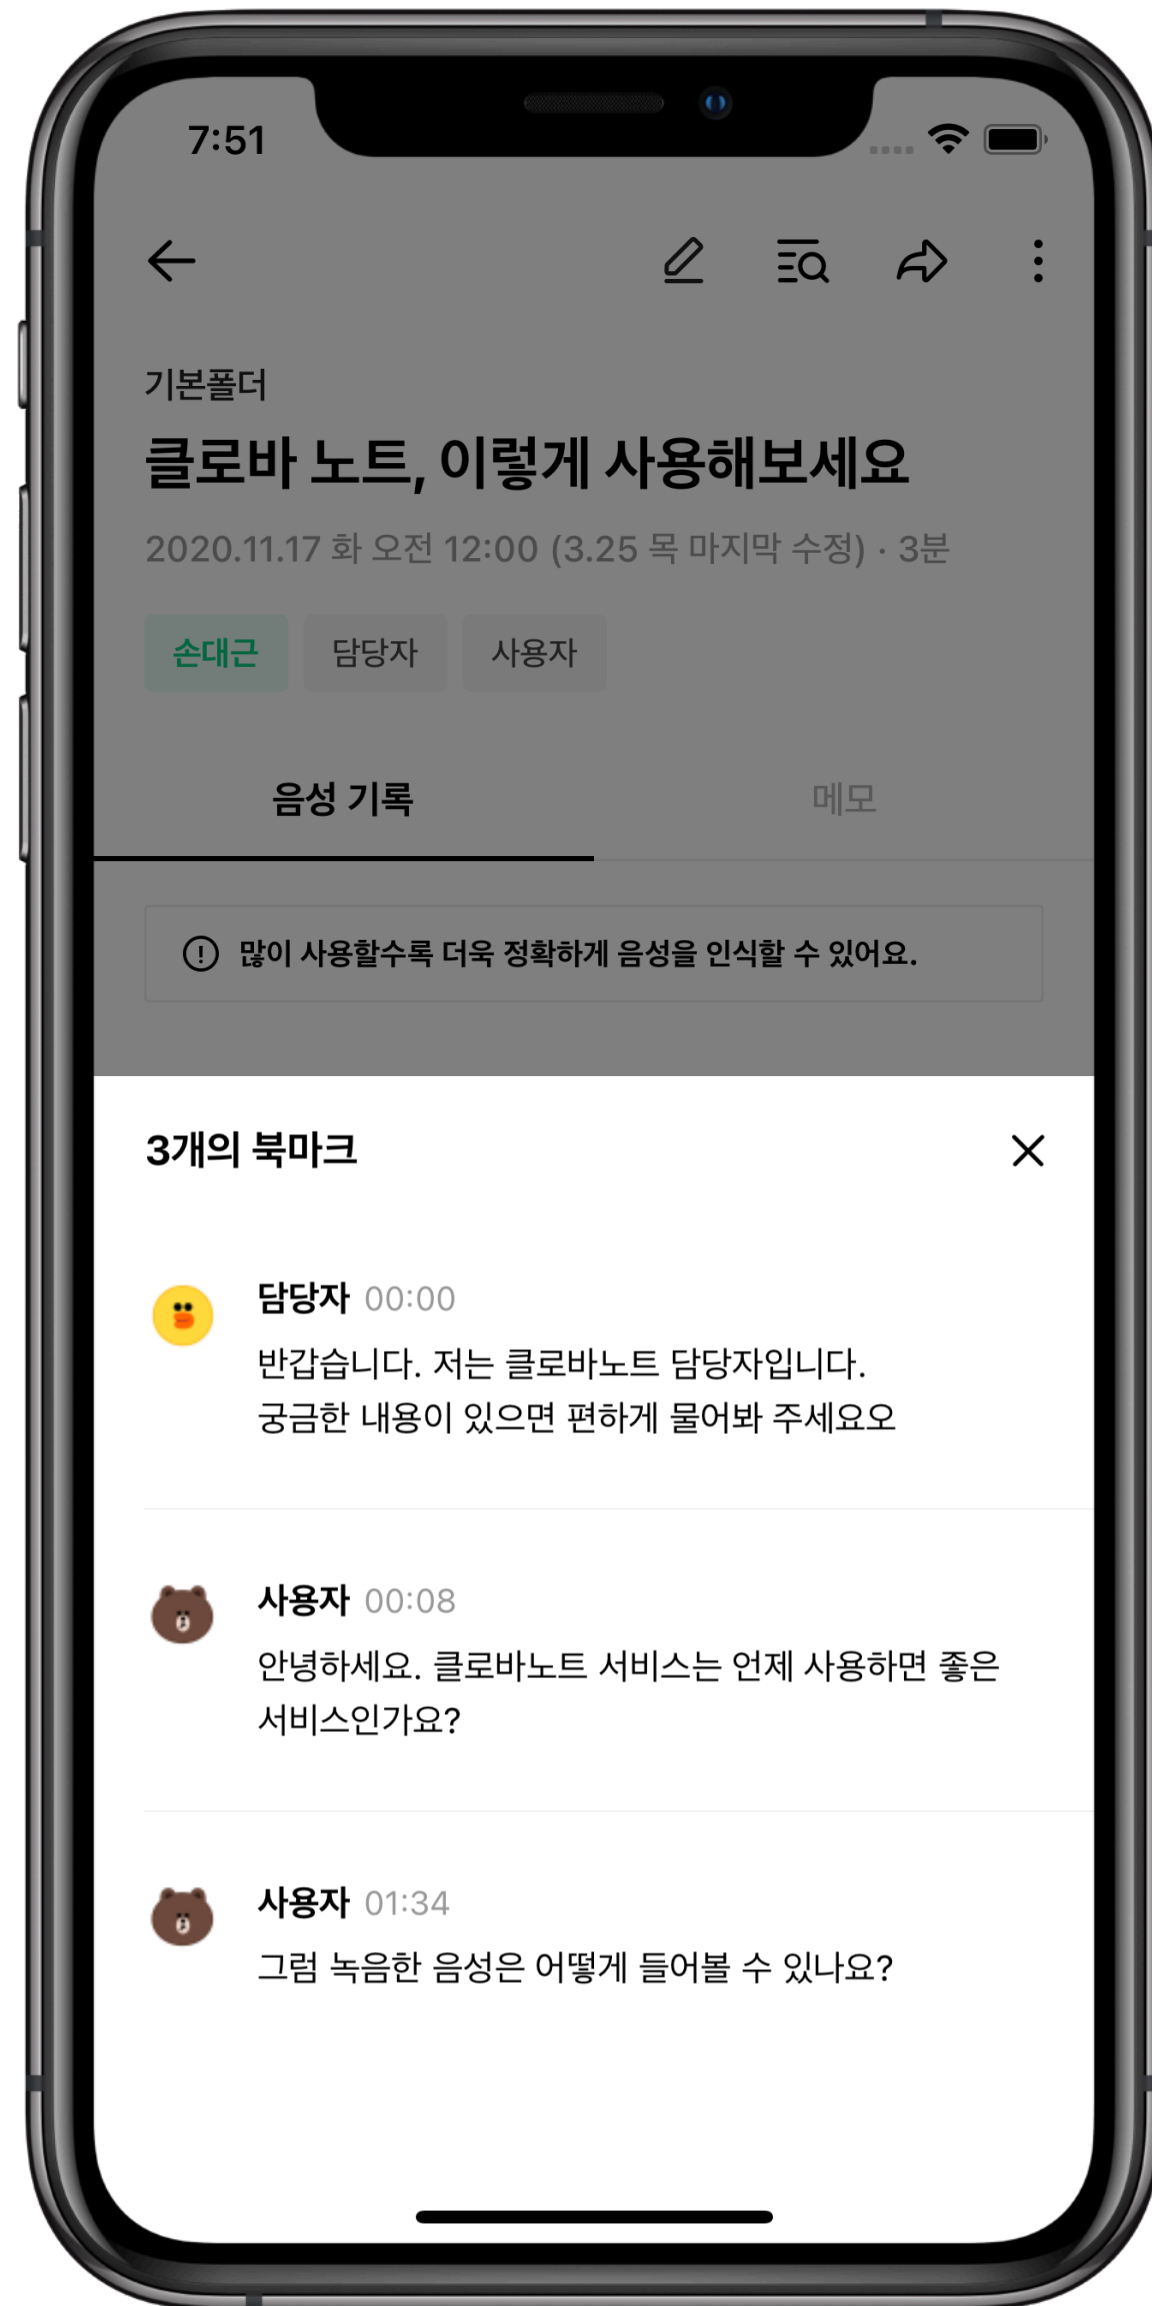

View

```
struct NoteView: View {  
  
    @ObservedObject var viewModel: NoteViewModel  
  
    var body: some View {  
        VStack {  
            NoteHeaderView(title: viewModel.title)  
            TabView {  
                NoteScriptView(blocks: viewModel.blocks,  
                               onTapBlock: { block in  
                                   viewModel.playBlock(block: block)  
                               })  
                NoteMemoView(memos: viewModel.memos)  
            }  
            NotePlayerView()  
        }  
    }  
}
```

```
struct NoteView: View {  
  
    @ObservedObject var viewModel: NoteViewModel  
  
    @State var showFontOption: Bool = false  
  
    var body: some View {  
        TabView {  
            NoteScriptView(viewModel: viewModel)  
            NoteMemoView(viewModel: viewModel)  
        }  
        .sheet(isPresented: $showFontOption,  
              content: {  
                NoteFontOptionView()  
            })  
    }  
}
```

Custom View Transition

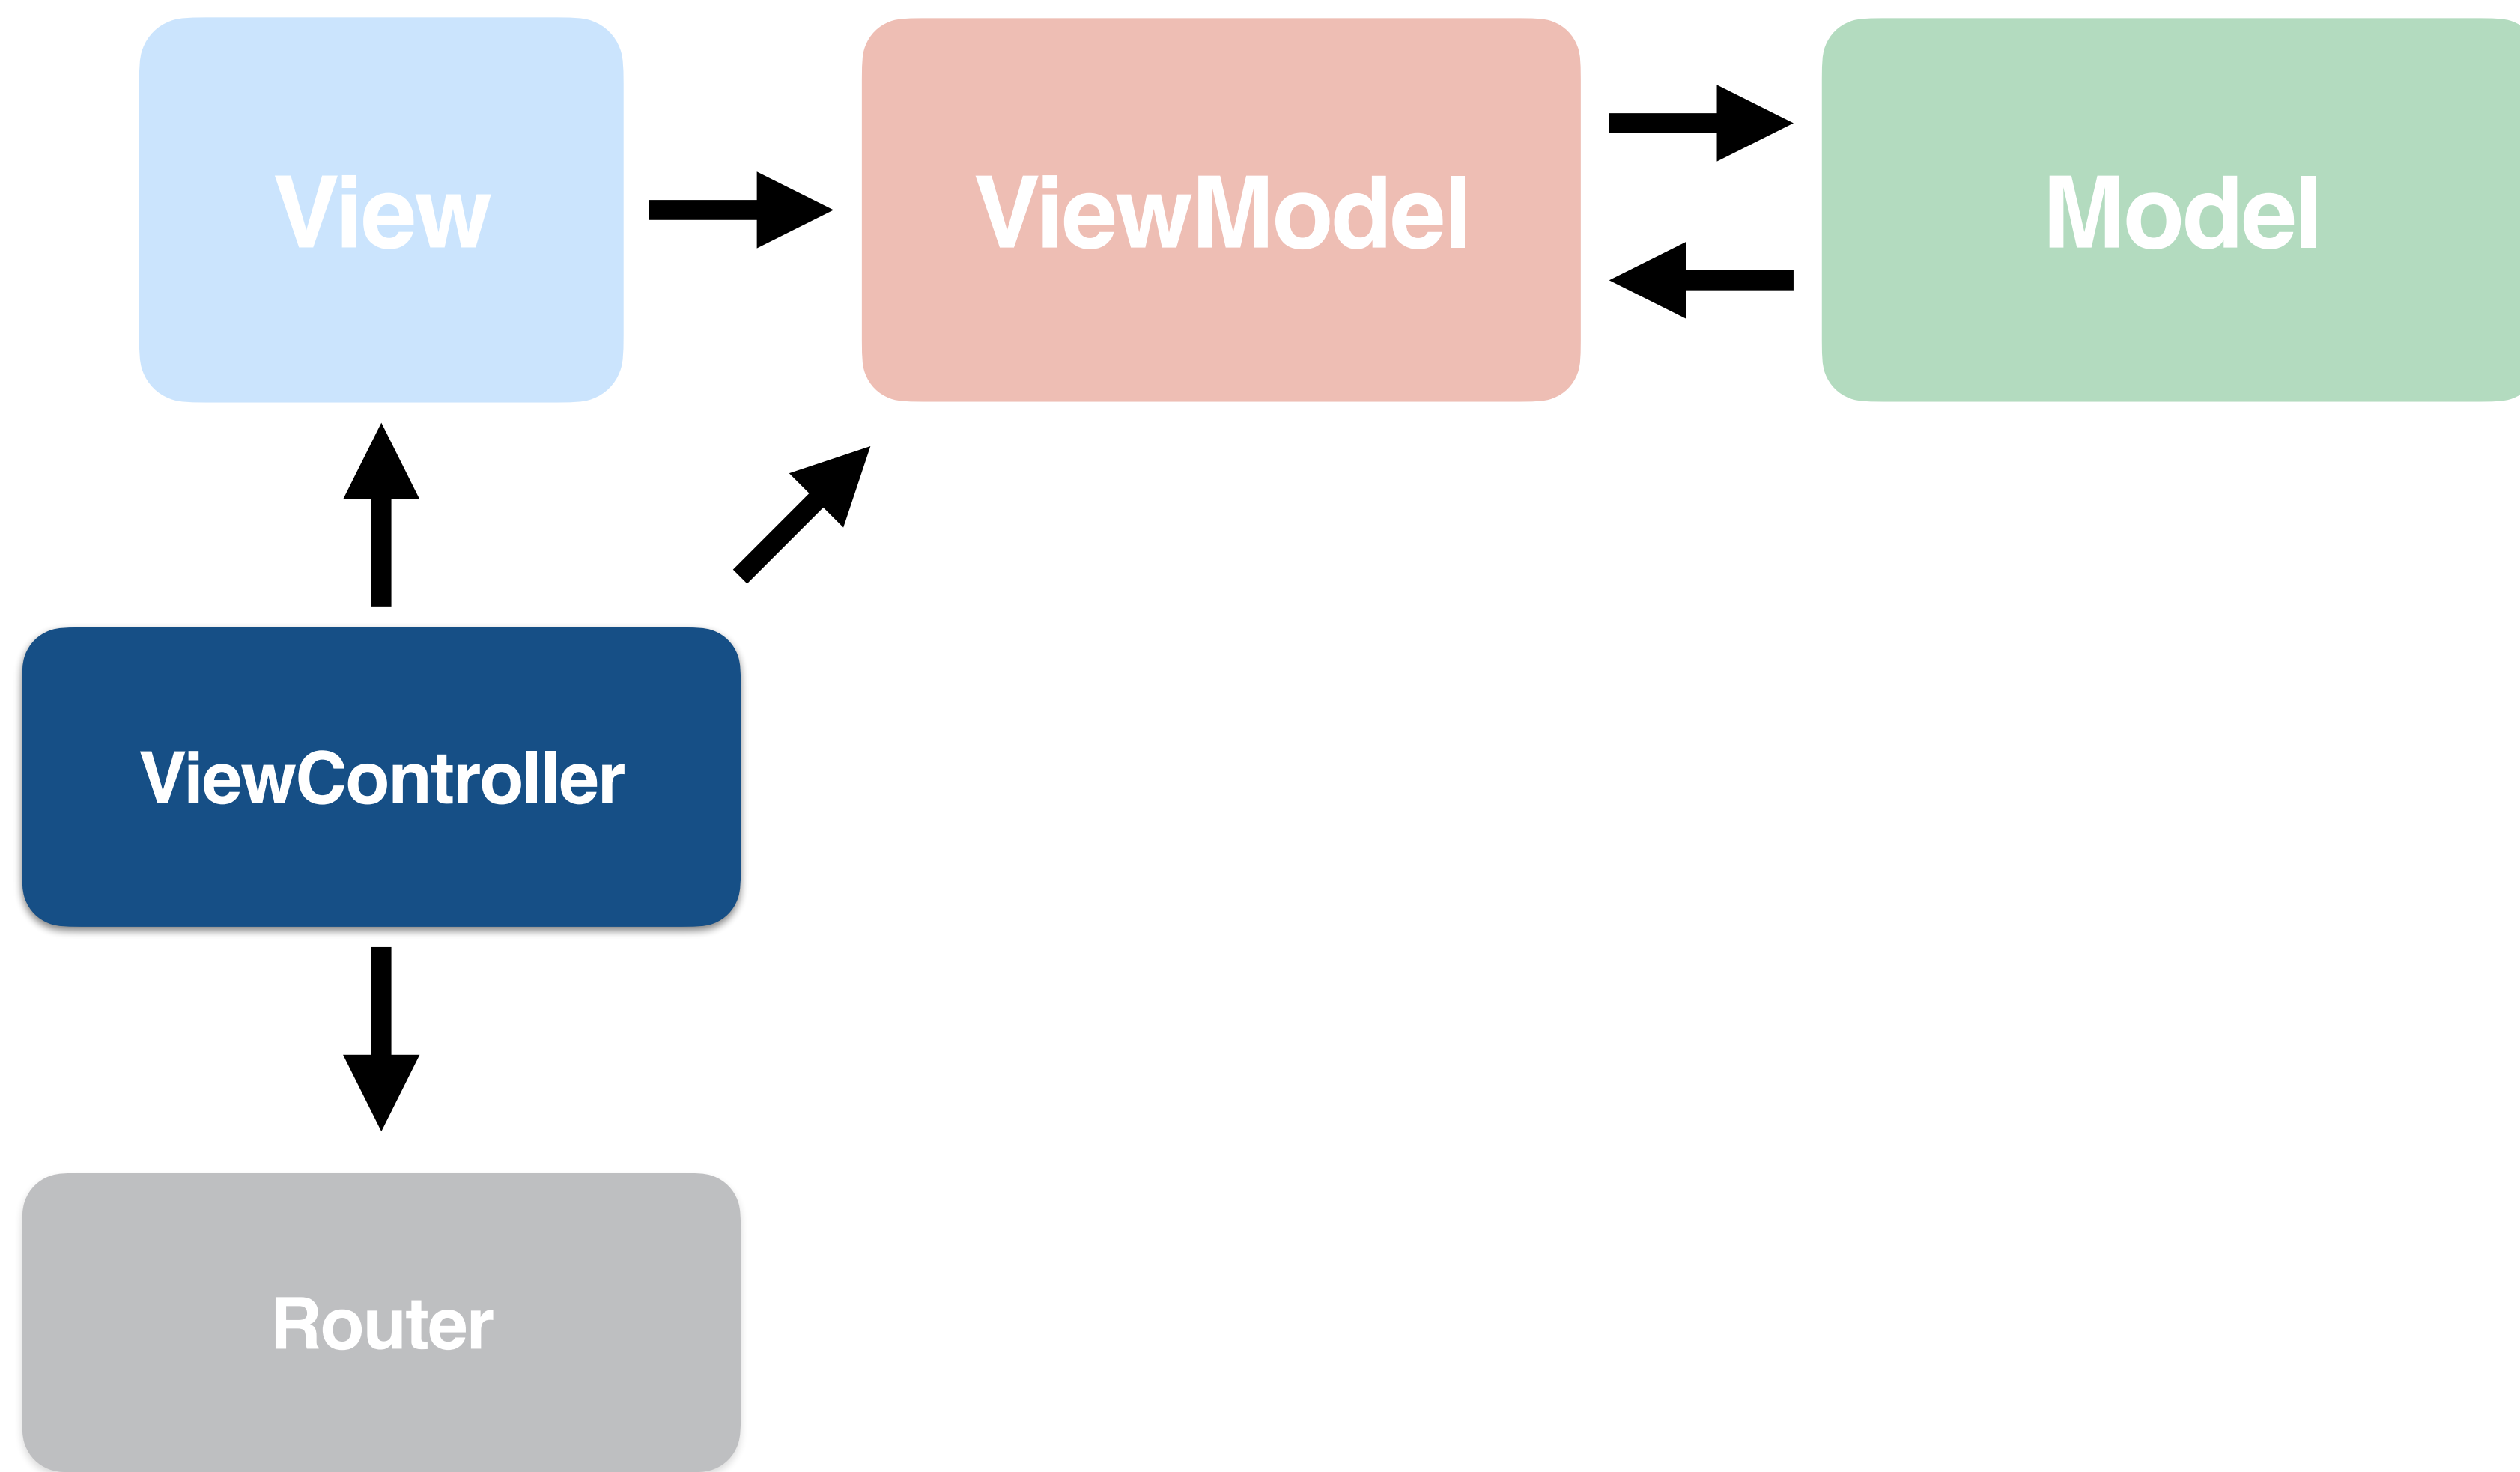

Deep Link

UIViewControllerTransitioningDelegate

UIPercentDrivenInteractiveTransition

UIHostingController

```
class NoteViewController: UIHostingController<NoteView> {  
  
    init() {  
        let viewModel = NoteViewModel()  
        let view = NoteView(viewModel: viewModel)  
  
        super.init(rootView: view)  
    }  
}
```

UIHostingController

SwiftUI View

TabBarController

UINavigationController

UINavigationController
<SwiftUIView>

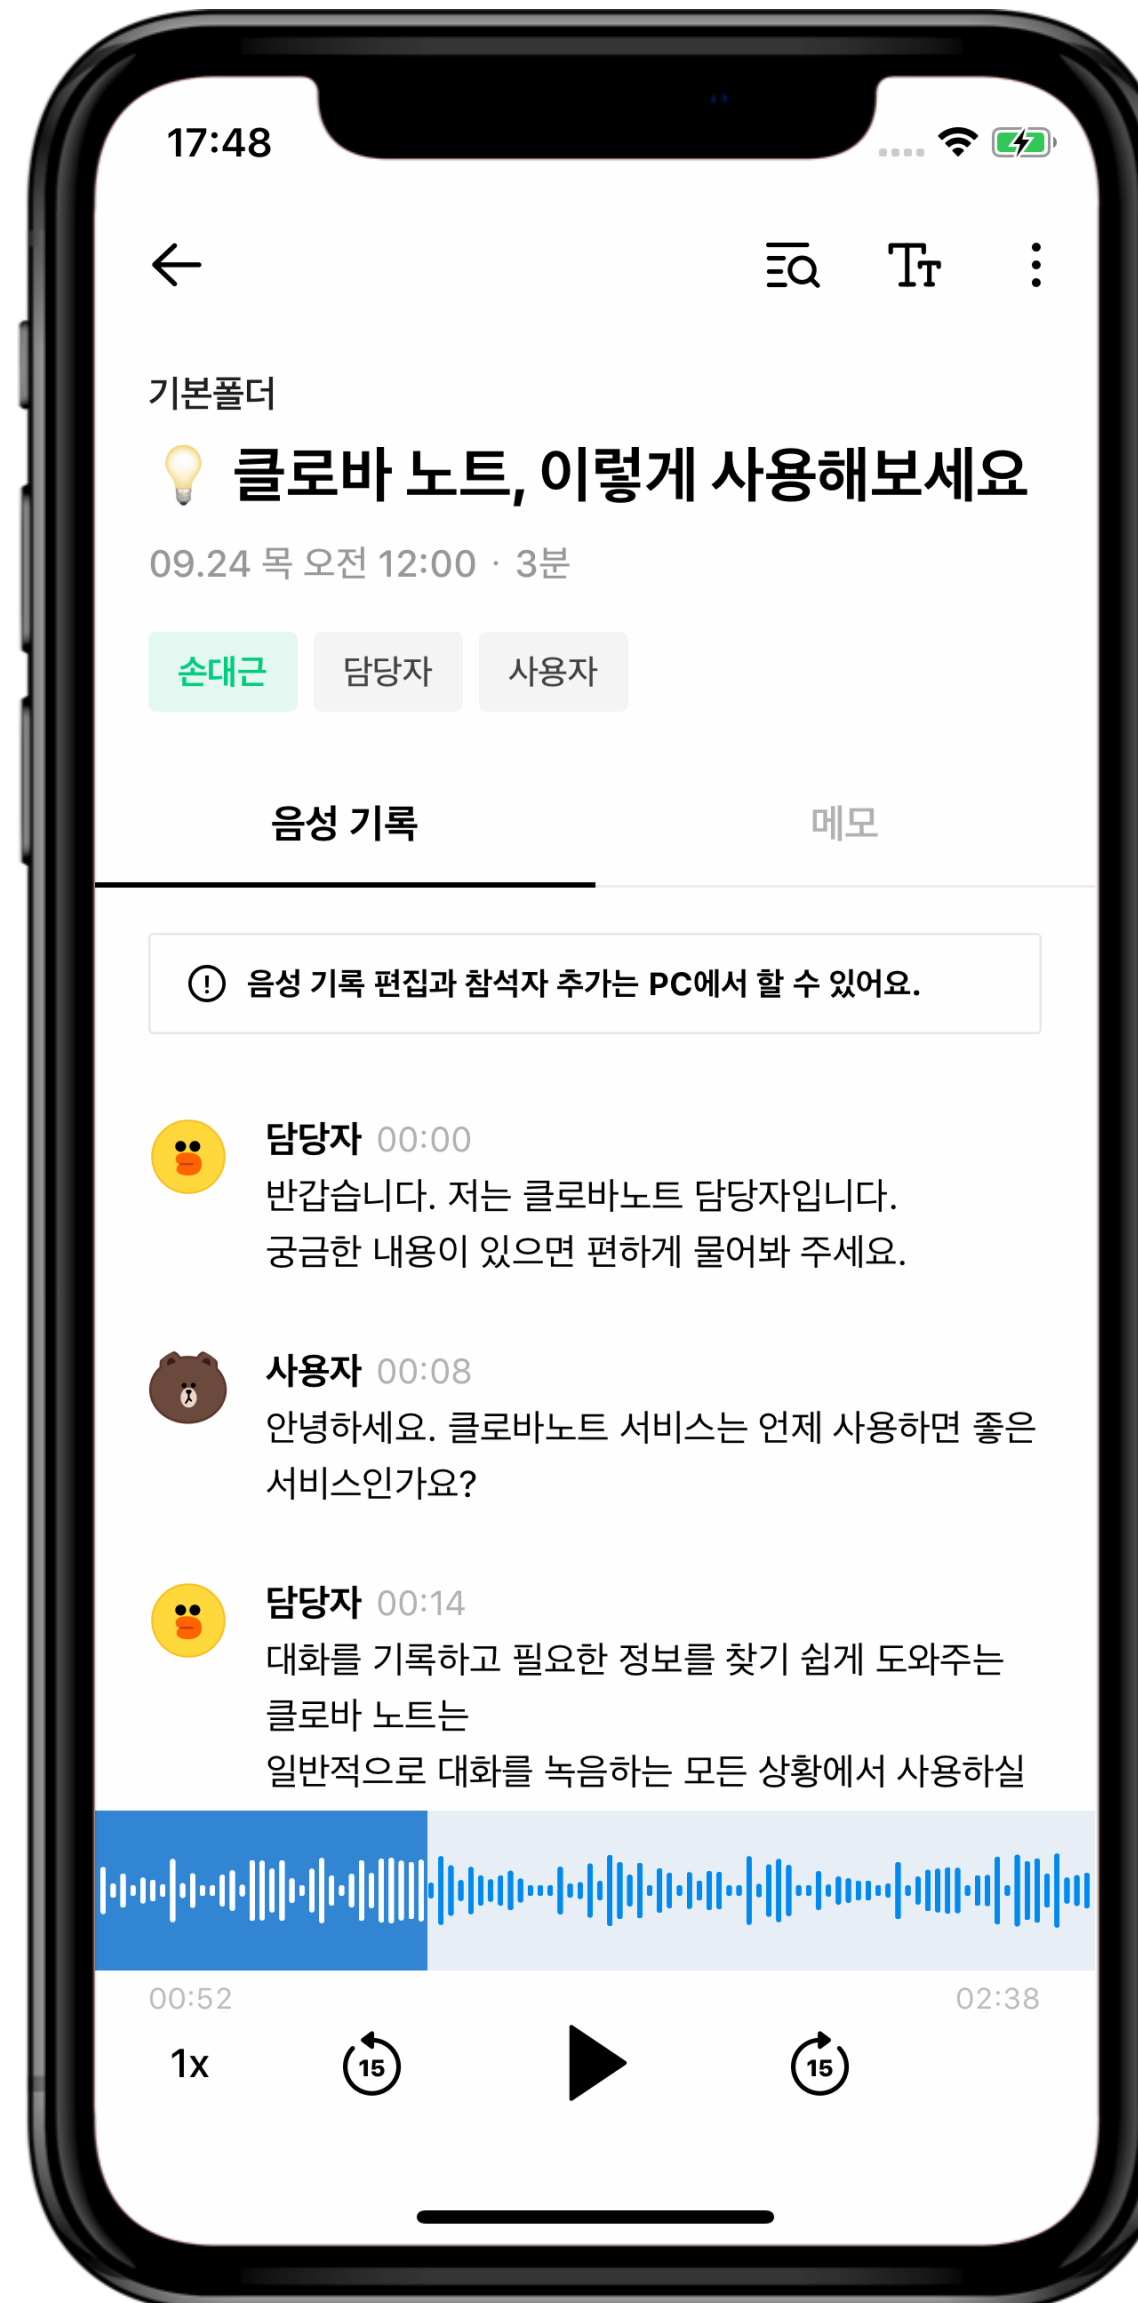

UINavigationController

UINavigationController
<SwiftUIView>

UIViewRepresentable

UIViewRepresentable

```
struct UINoteScriptView: UIViewRepresentable {  
    @ObservedObject var viewModel: NoteViewModel  
  
    func makeUIView(context: Context) -> NoteScriptTableView {  
        return NoteScriptTableView()  
    }  
  
    func updateUIView(_ uiView: NoteScriptTableView, context: Context) {  
        // update  
    }  
}
```

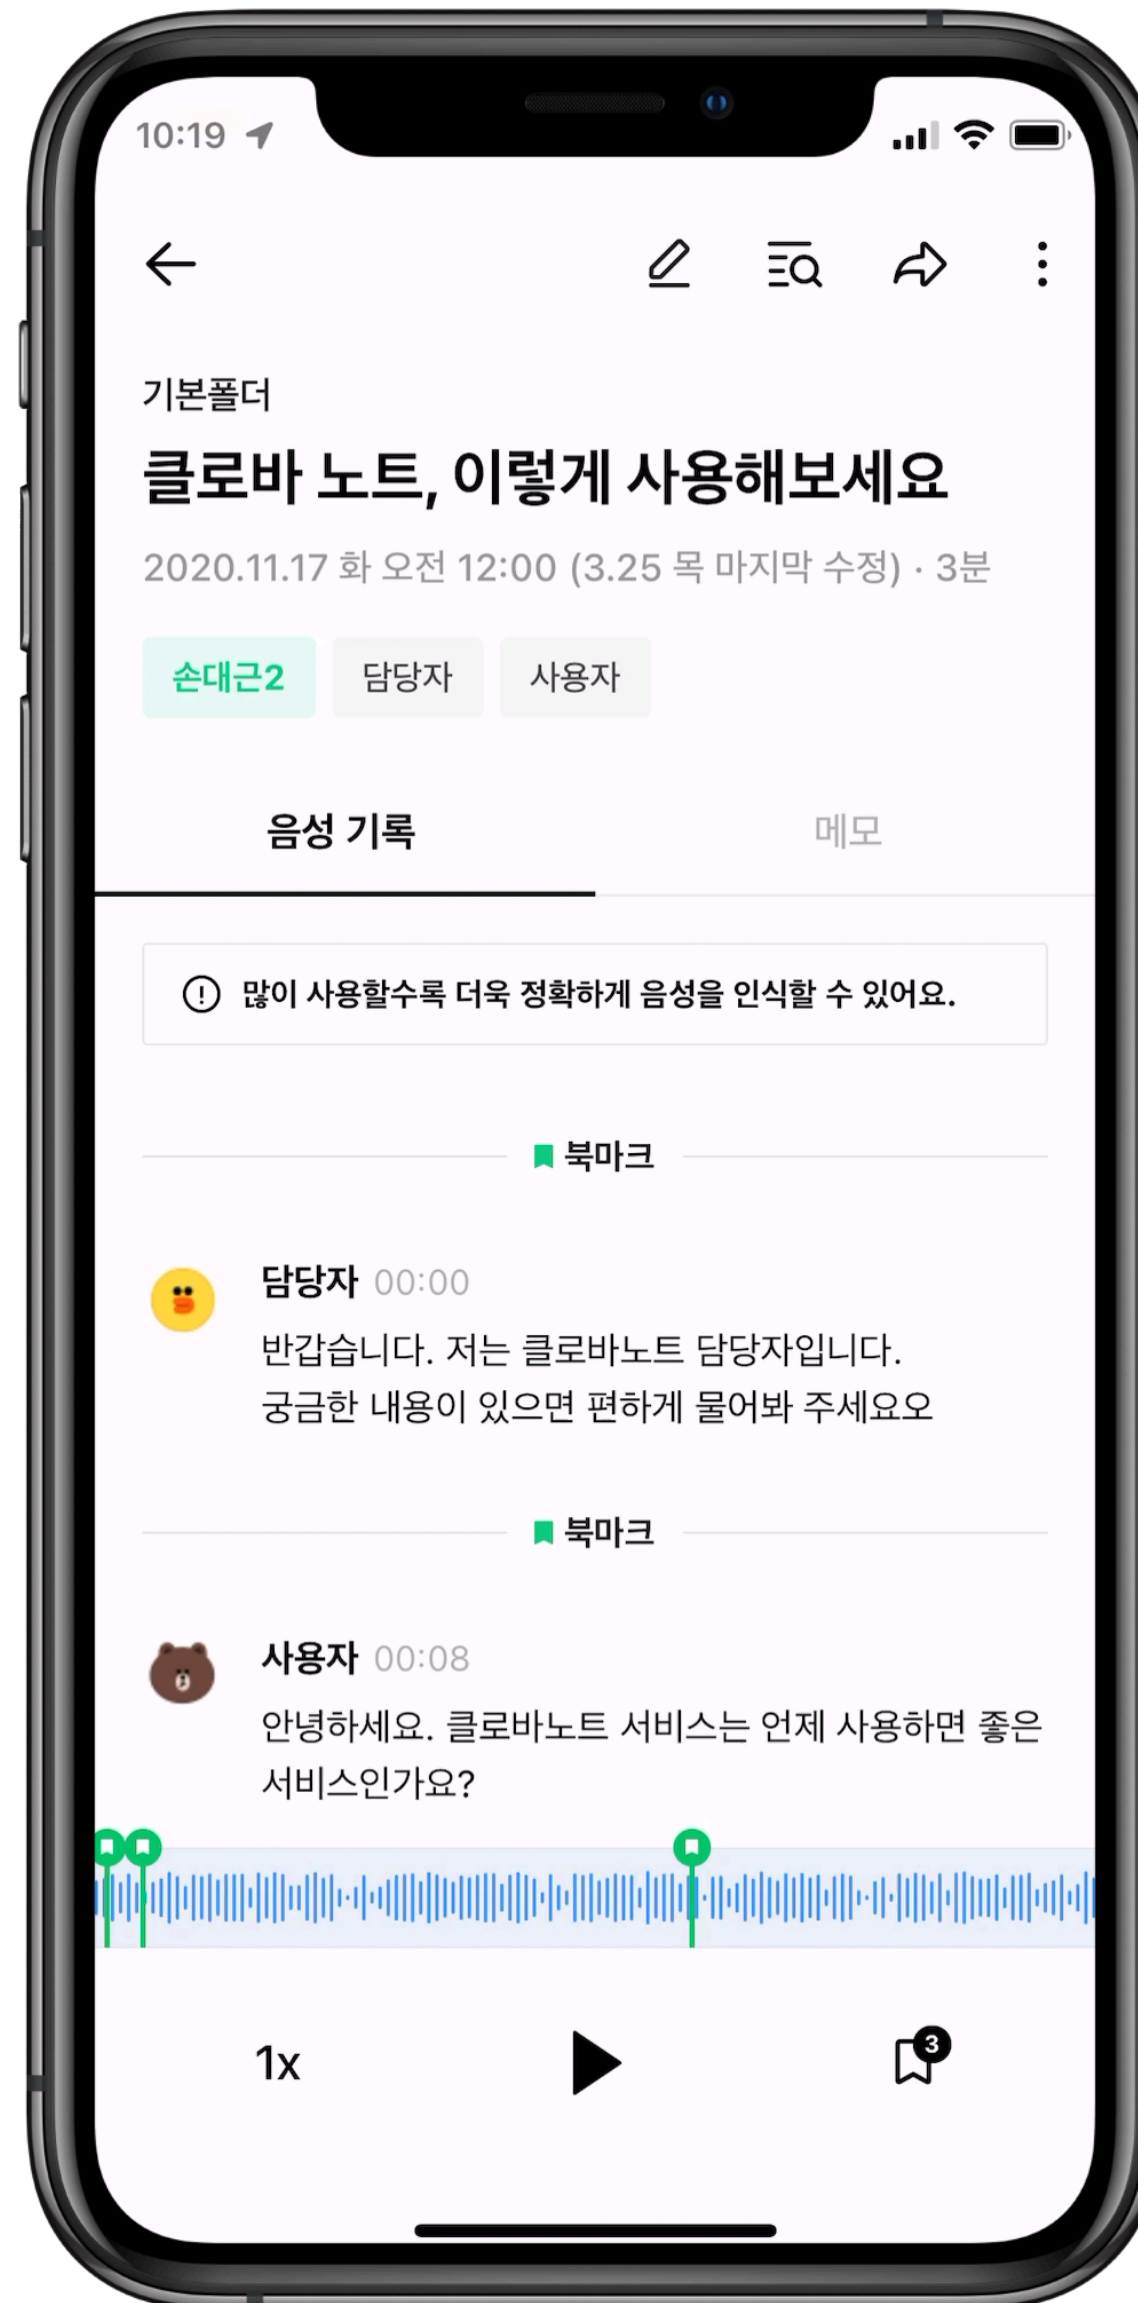

TabView

List
(스크립트)

List
(메모)

```
struct NoteView: View {  
  
    @ObservedObject var viewModel: NoteViewModel  
  
    var body: some View {  
        VStack {  
            NoteHeaderView(title: viewModel.title)  
            TabView {  
                NoteScriptView(blocks: viewModel.blocks,  
                                onTapBlock: { block in  
                                    viewModel.playBlock(block: block)  
                                })  
                NoteMemoView(memos: viewModel.memos)  
            }  
            .tabViewStyle(.page)  
            NotePlayerView()  
        }  
    }  
}
```

UITableView - scrollToRow

```
func moveToBlock(_ block: NoteScriptBlockViewModel, animated: Bool = true) {  
    guard let row = speeches.firstIndex(of: block) else {  
        return  
    }  
  
    scriptTableView.scrollToRow(at: IndexPath(row: row, section: 0), at: .top, animated: animated)  
}
```

UIViewRepresentable

```
struct UINoteScriptView: UIViewRepresentable {  
    @ObservedObject var viewModel: NoteViewModel  
  
    func makeUIView(context: Context) -> NoteScriptTableView {  
        return NoteScriptTableView()  
    }  
  
    func updateUIView(_ uiView: NoteScriptTableView, context: Context) {  
        // update  
    }  
}
```

UIViewRepresentable

```
struct NoteView: View {  
    @ObservedObject var viewModel: NoteViewModel  
  
    var body: some View {  
        VStack {  
            NoteHeaderView(title: viewModel.title)  
            TabView {  
                UINoteScriptView(viewModel: viewModel)  
                UINoteMemoView(viewModel: viewModel)  
            }  
            NotePlayerView()  
        }  
    }  
}
```

UIViewRepresentable

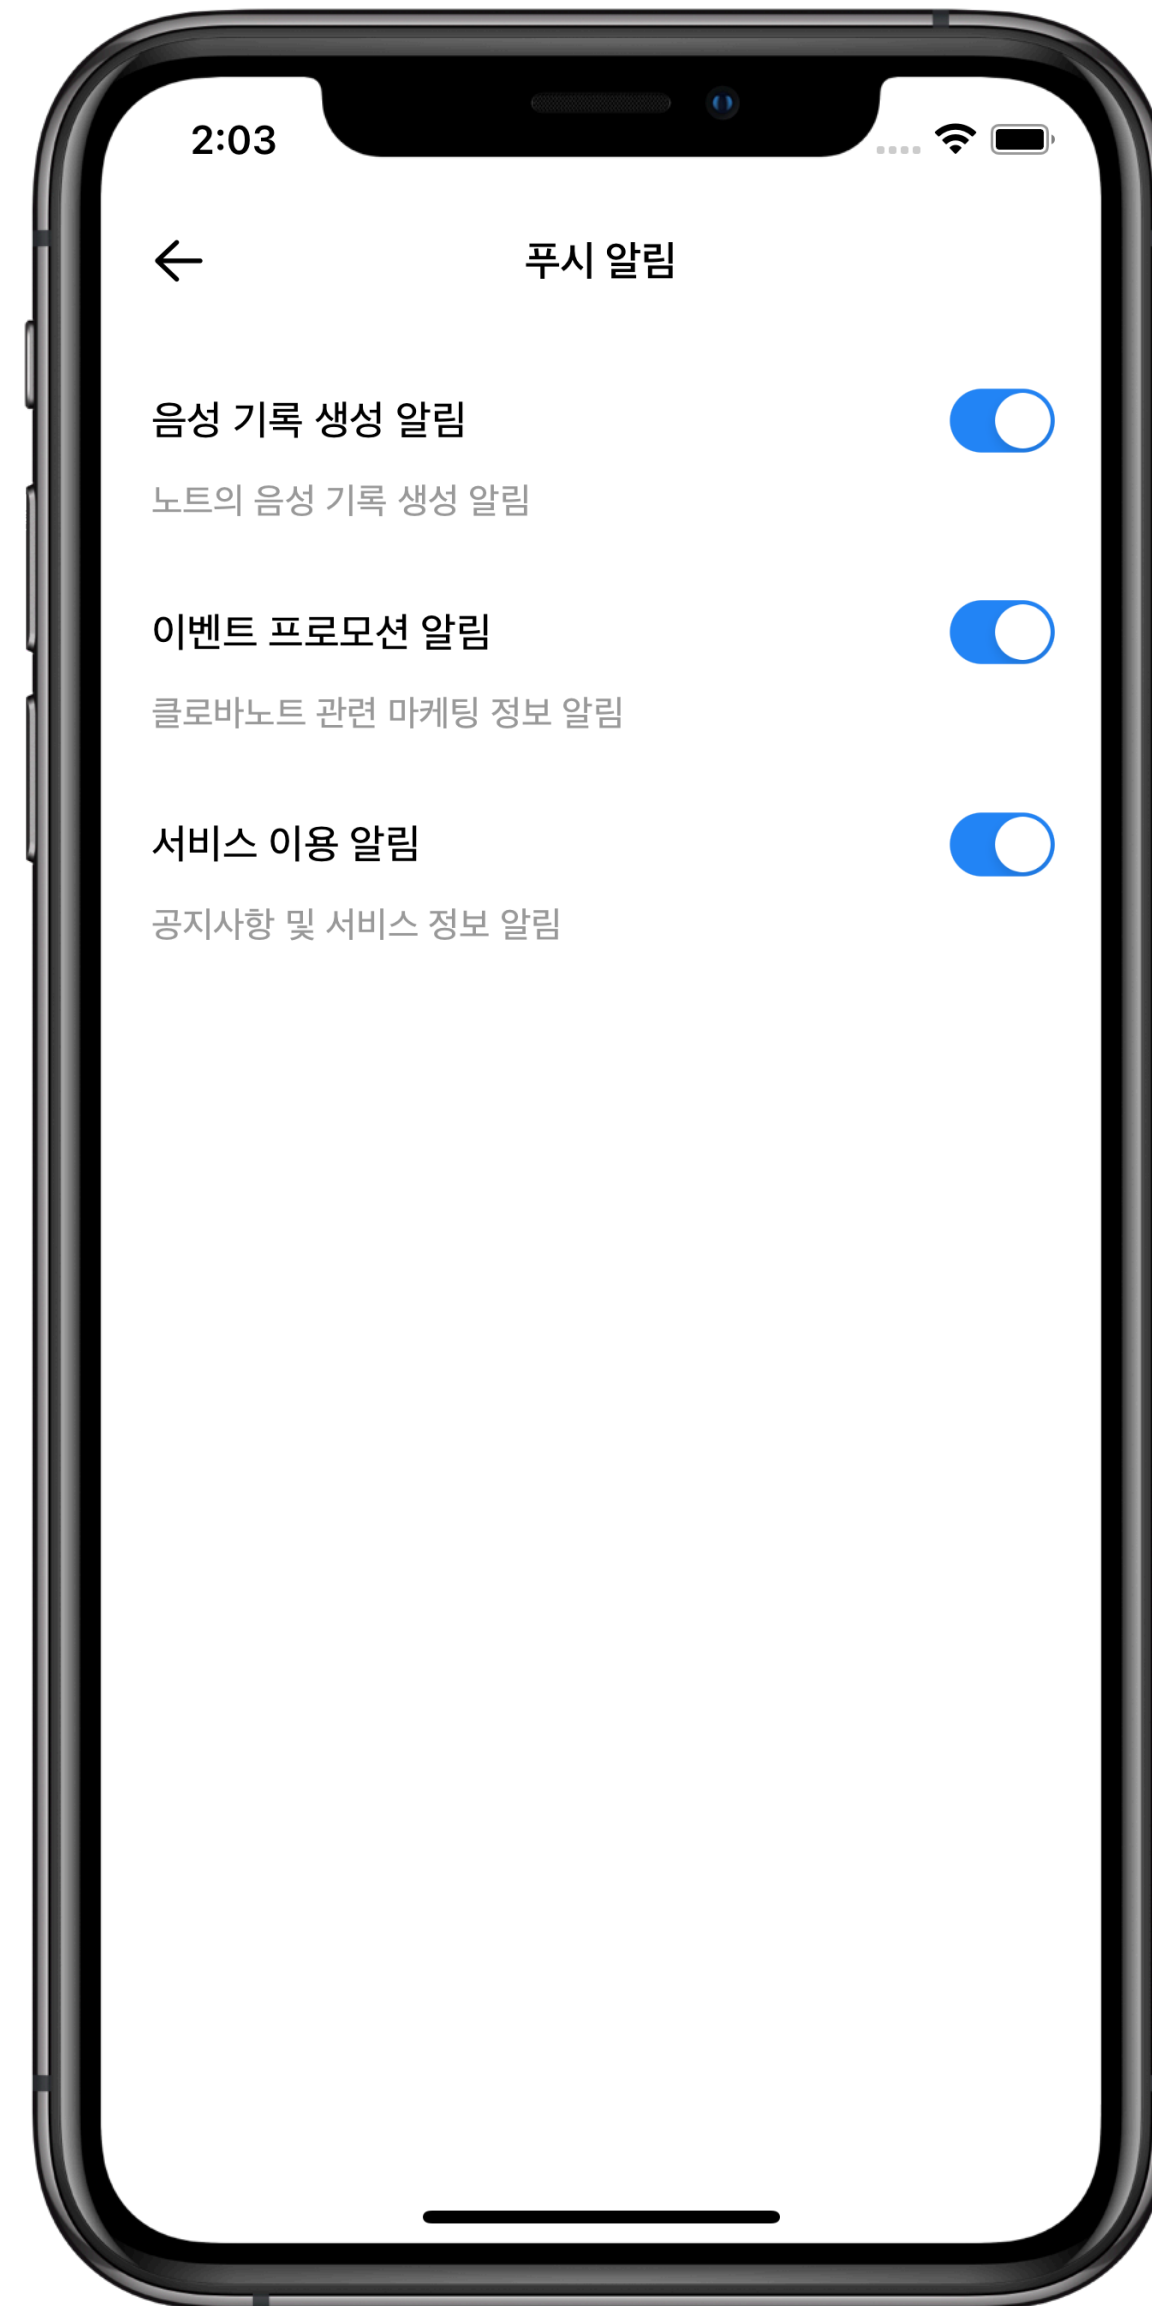

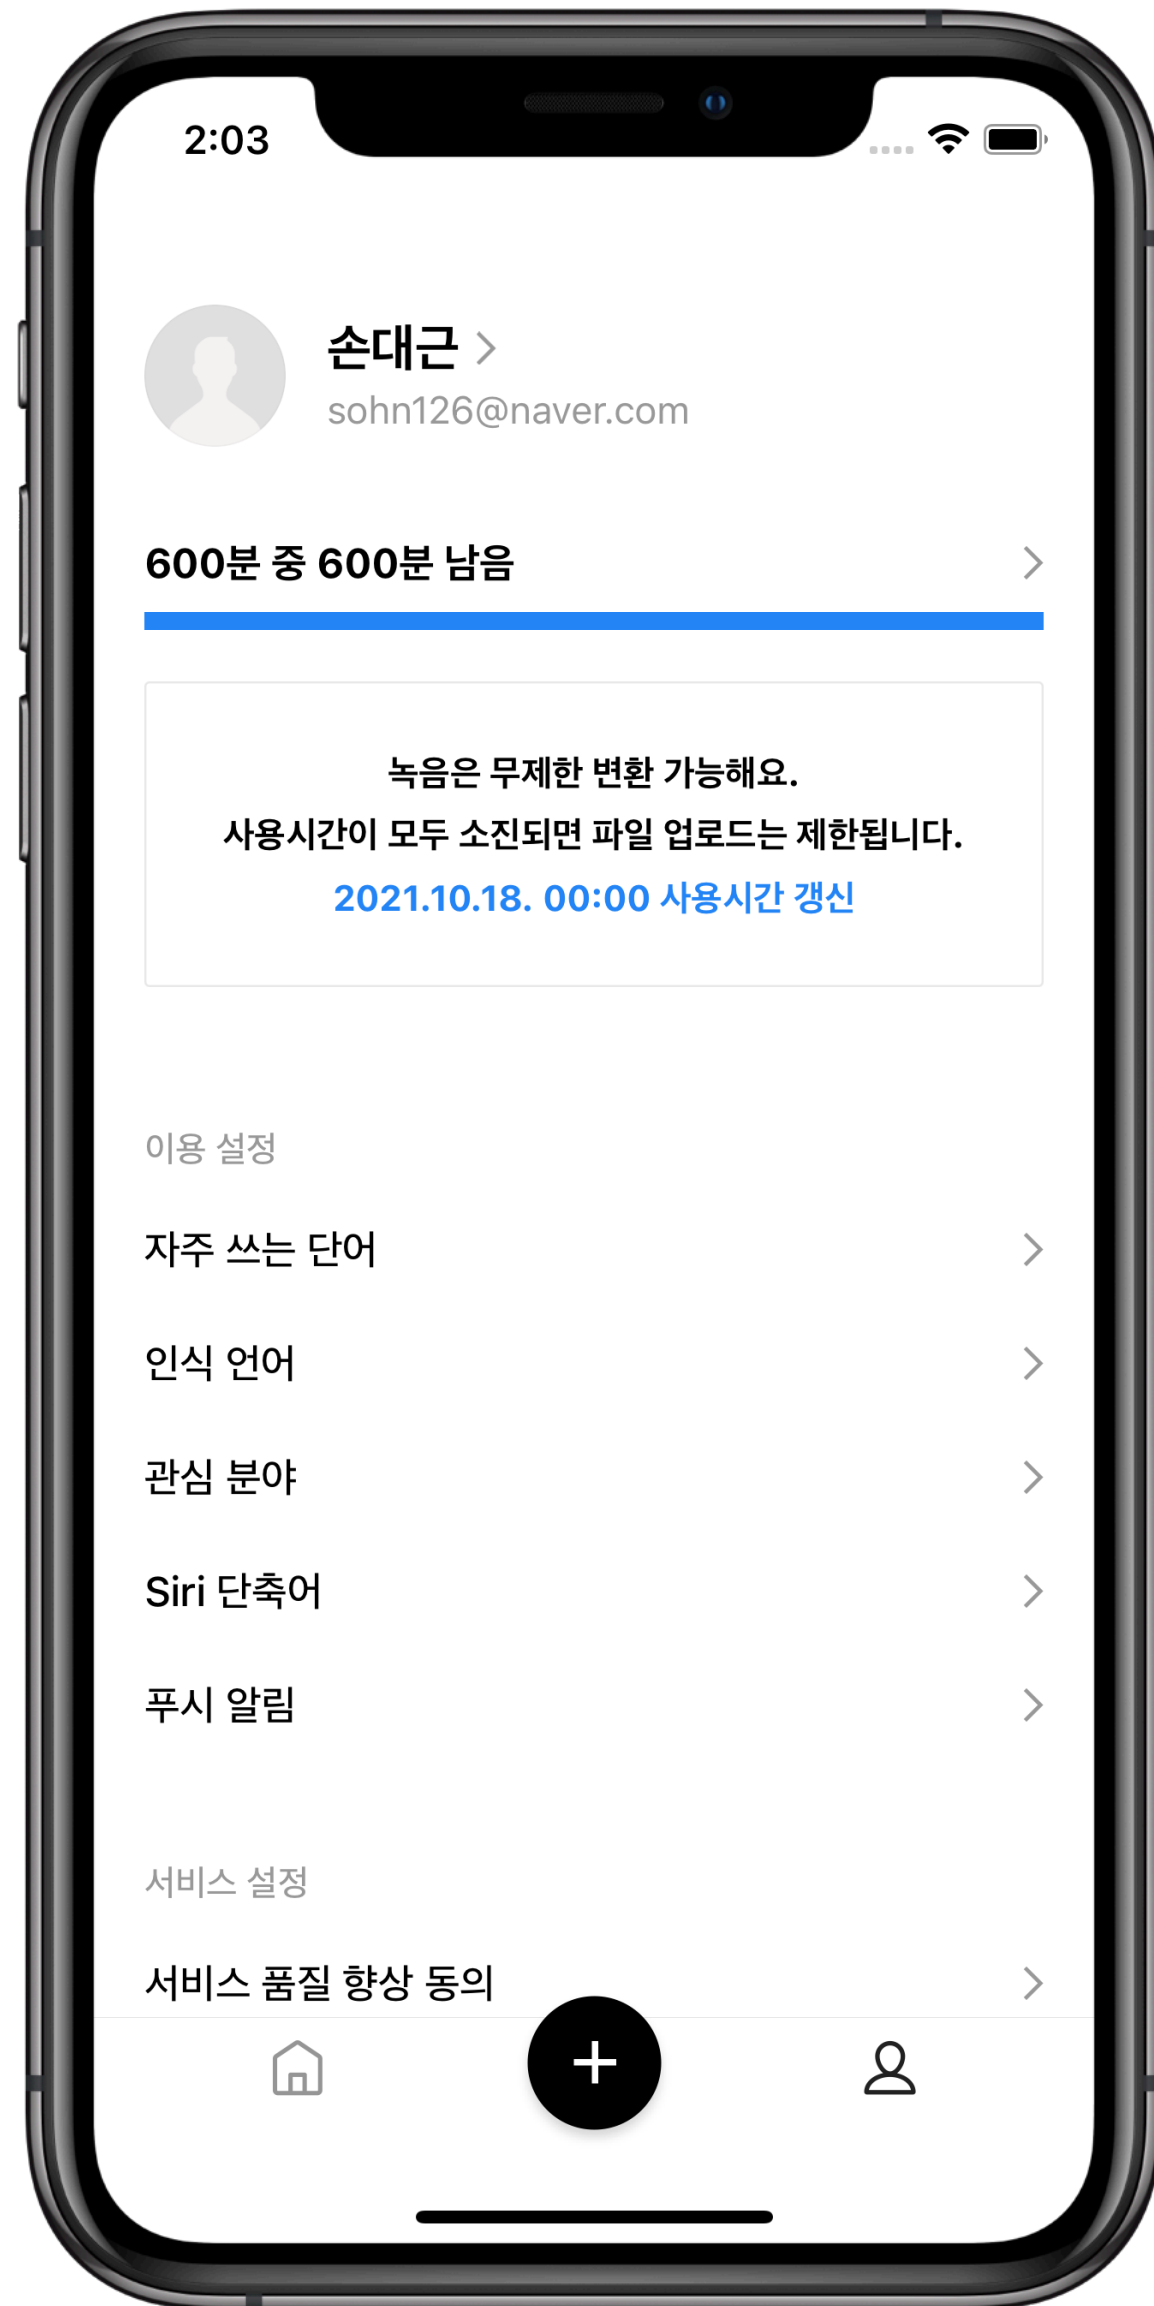

```
class NoteViewModel: ObservableObject {  
  
    @Published var focusedBlock: NoteScriptBlock?  
    @Published var blocks: [NoteScriptBlock] = []  
    @Published var memos: [NoteMemo] = []  
  
    init() { ... }  
}
```

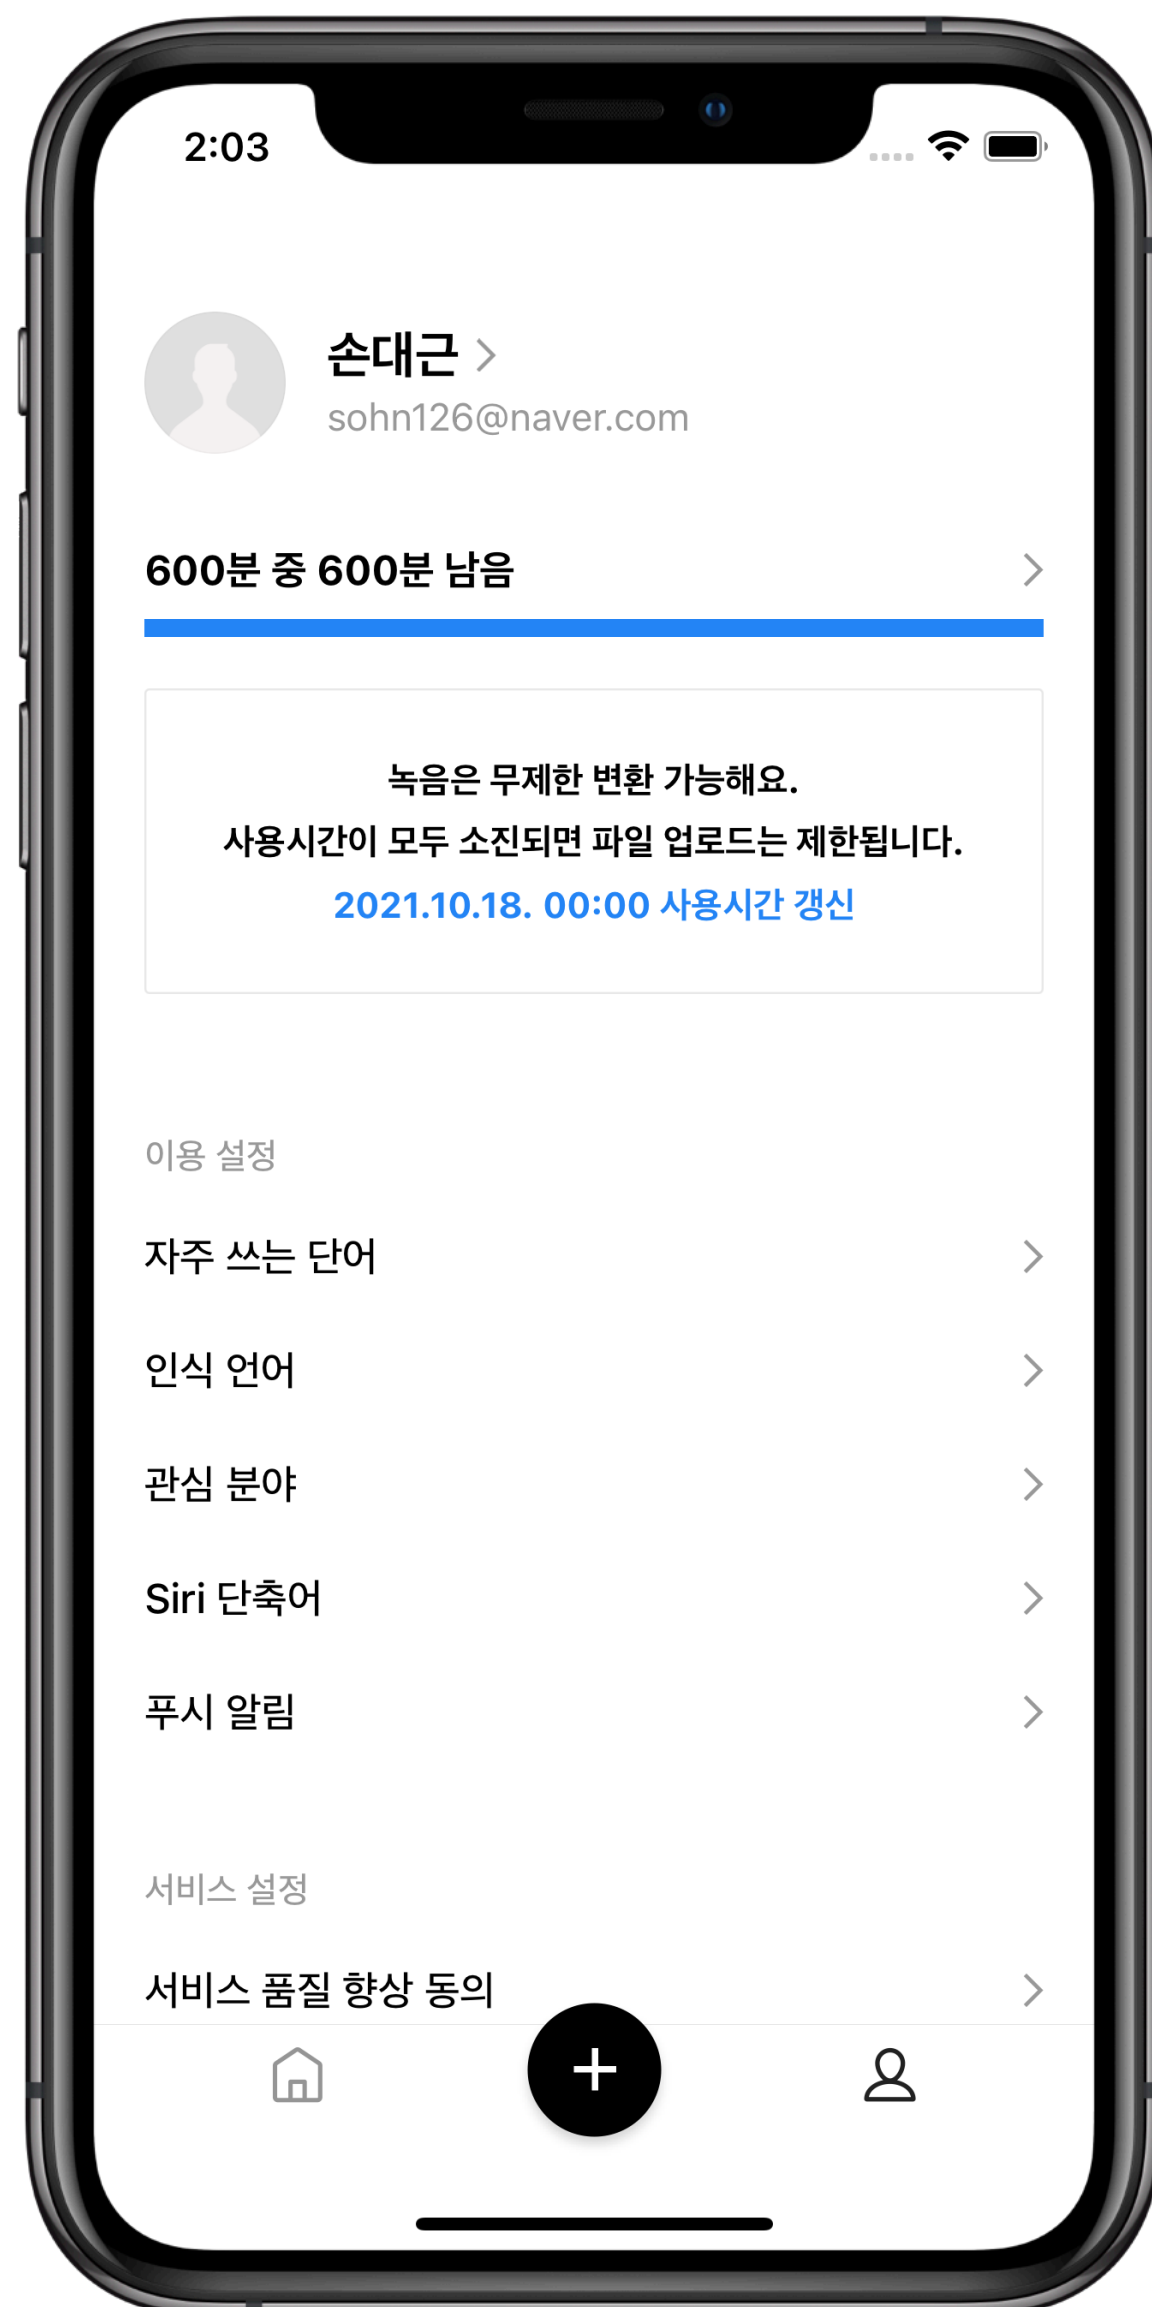

```
func updateUIView(_ uiView: NoteScriptTableView, context: Context) {  
    uiView.updateIfNeeded(blocks: viewModel.blocks)  
}
```

Improvement in SwiftUI 2 (iOS 14)

```
ScrollViewReader { proxy in
  List {
    ForEach(viewModel.scripts, content: { script in
      ScriptItemView(text: script.text)
        .id(script.id)
    })
  }
  .onReceive(viewModel.blockScrollPublisher, perform: { block in
    proxy.scrollTo(block.id)
  })
}
```

Simple Views

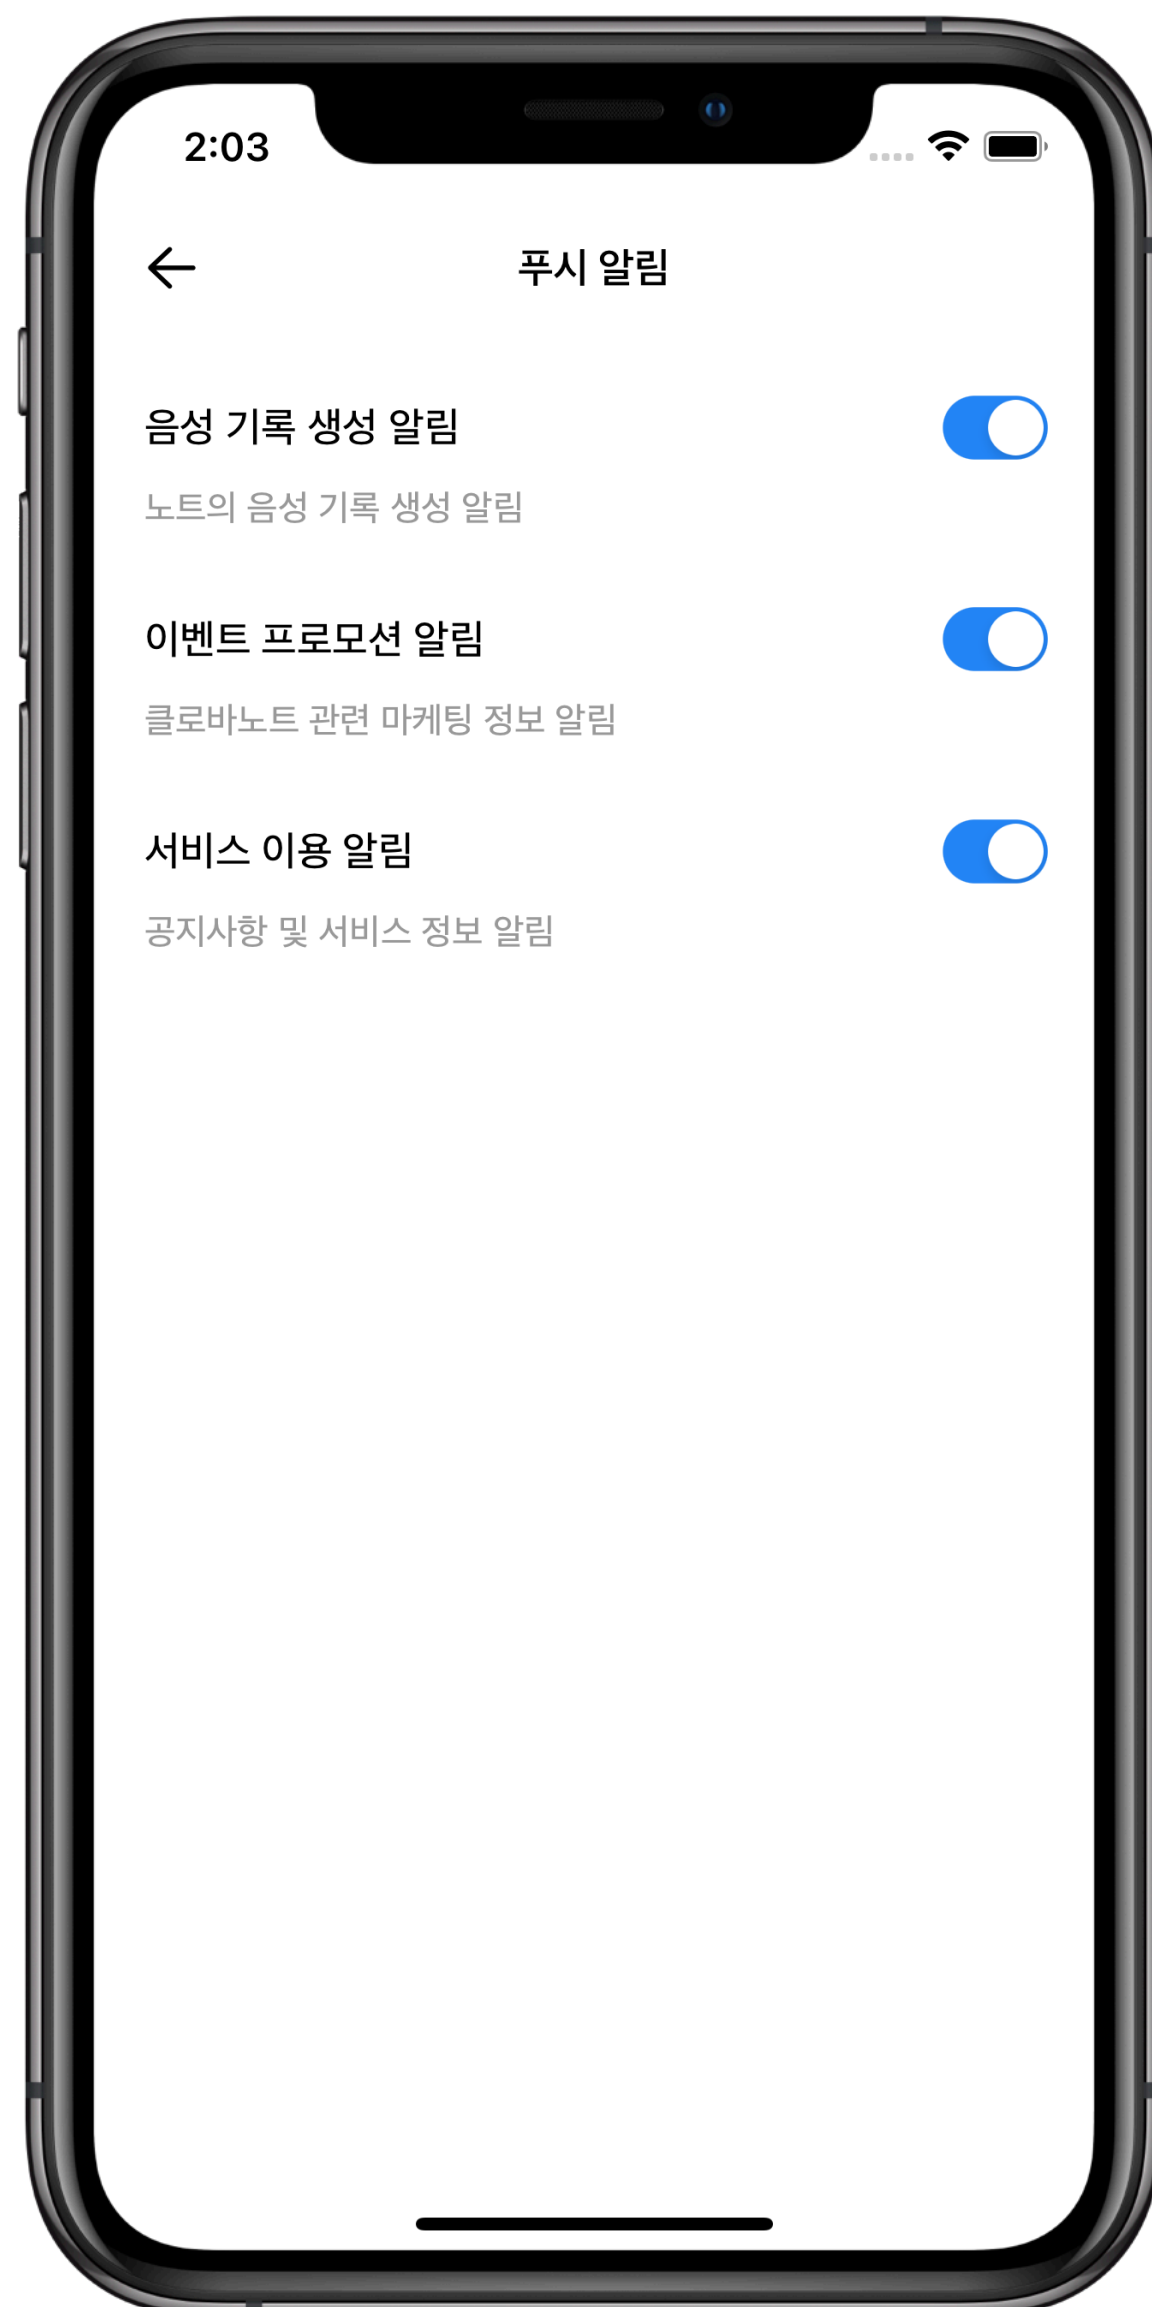

```

var body: some View {
    List {
        SettingsUserInformationView()
        Section(header: SettingsSectionHeaderView(title: "서비스 설정")) {
            ForEach(serviceSettings) { item in
                SettingsItemView(name: item.name)
            }
        }
        Section(header: SettingsSectionHeaderView(title: "디바이스 설정")) {
            ForEach(deviceSettings) { item in
                SettingsItemView(name: item.name)
            }
        }
    }
    .listStyle(GroupedListStyle())
}

```

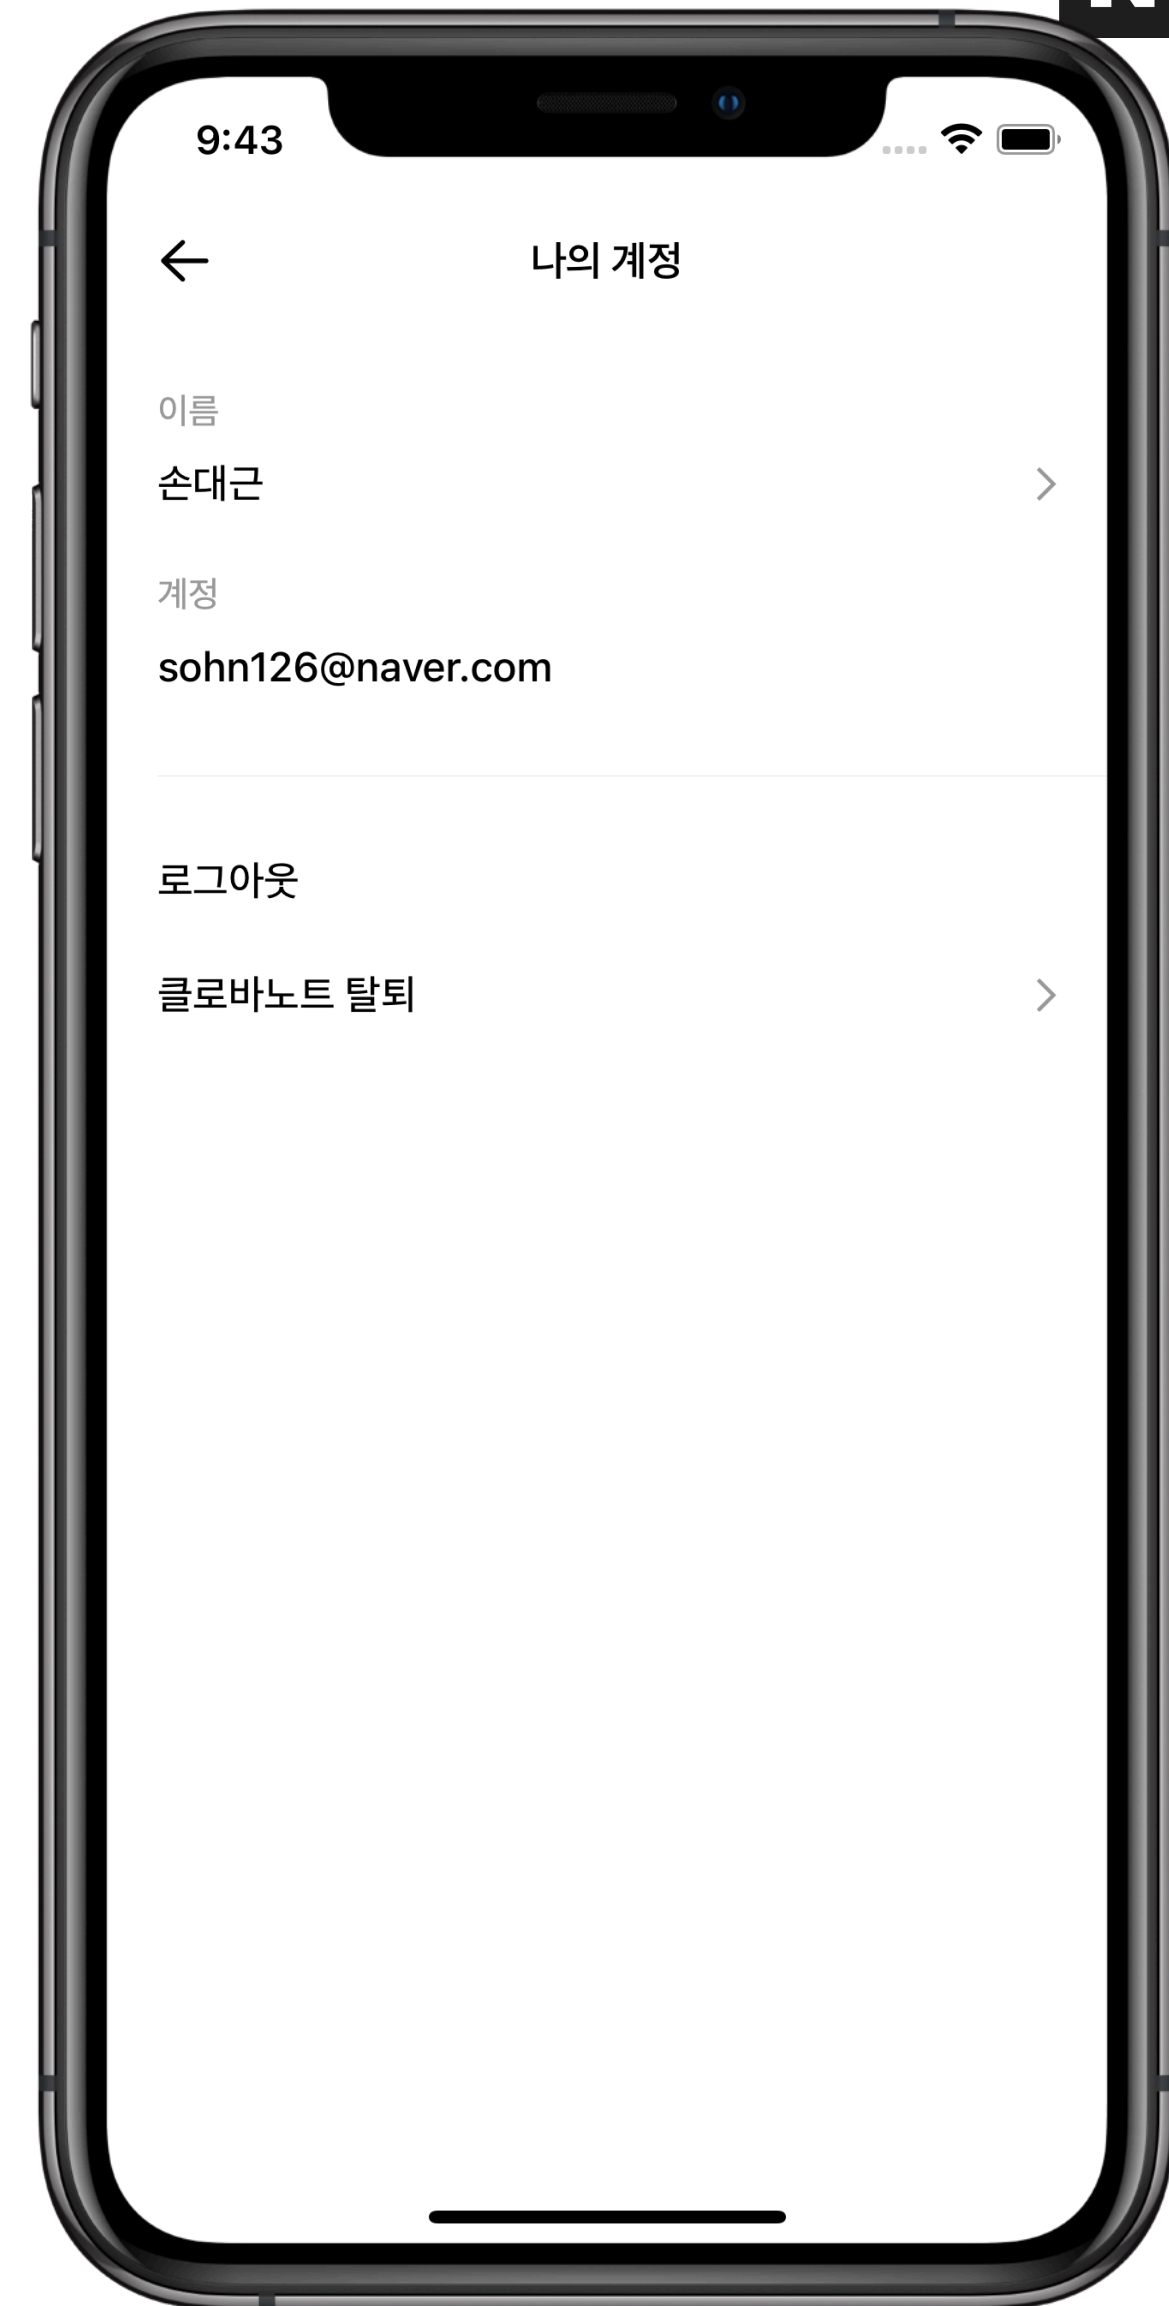

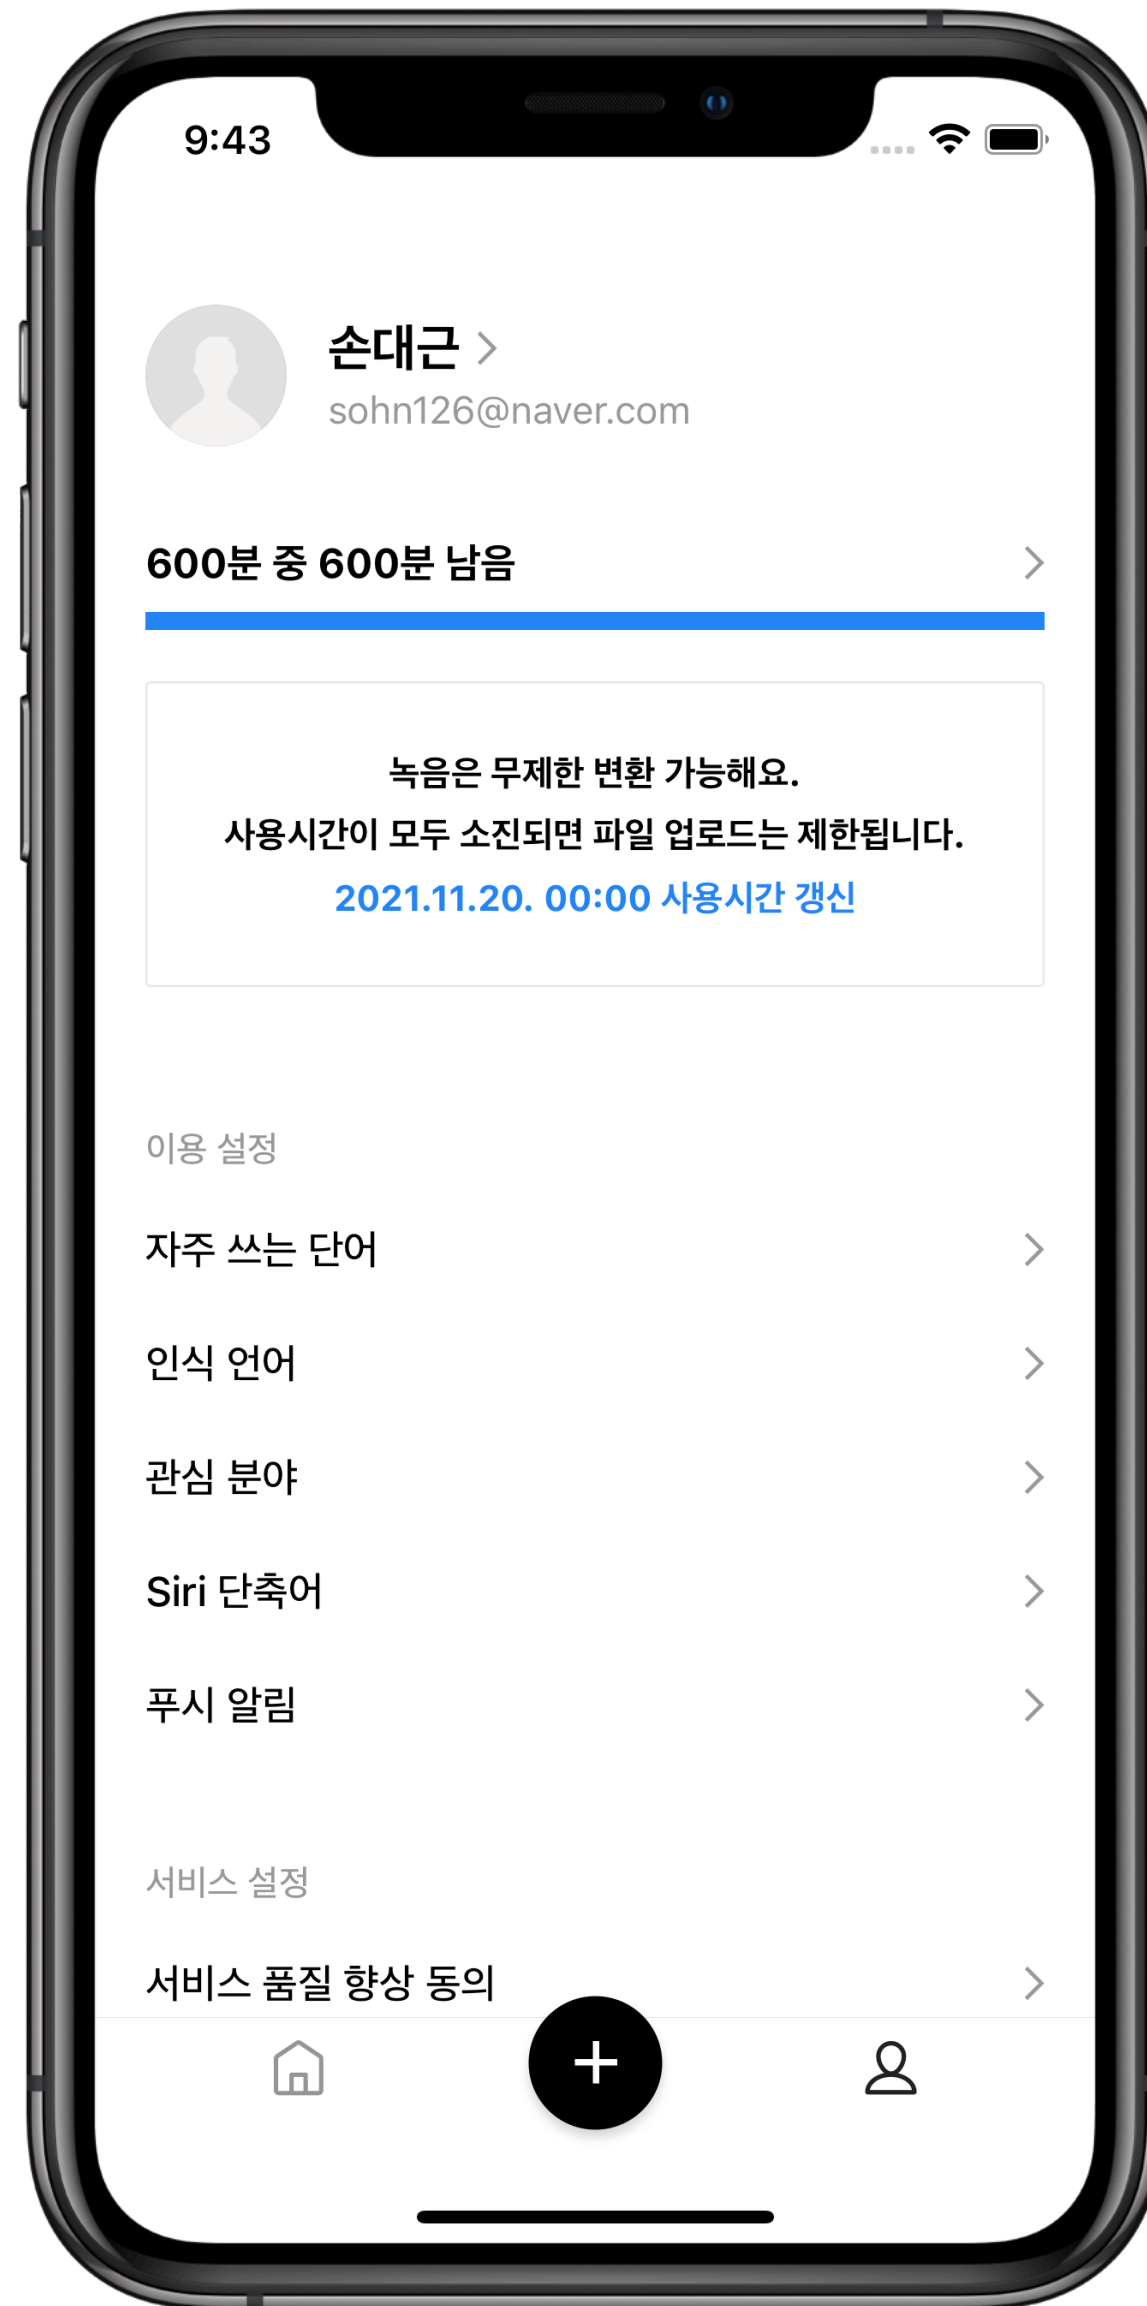

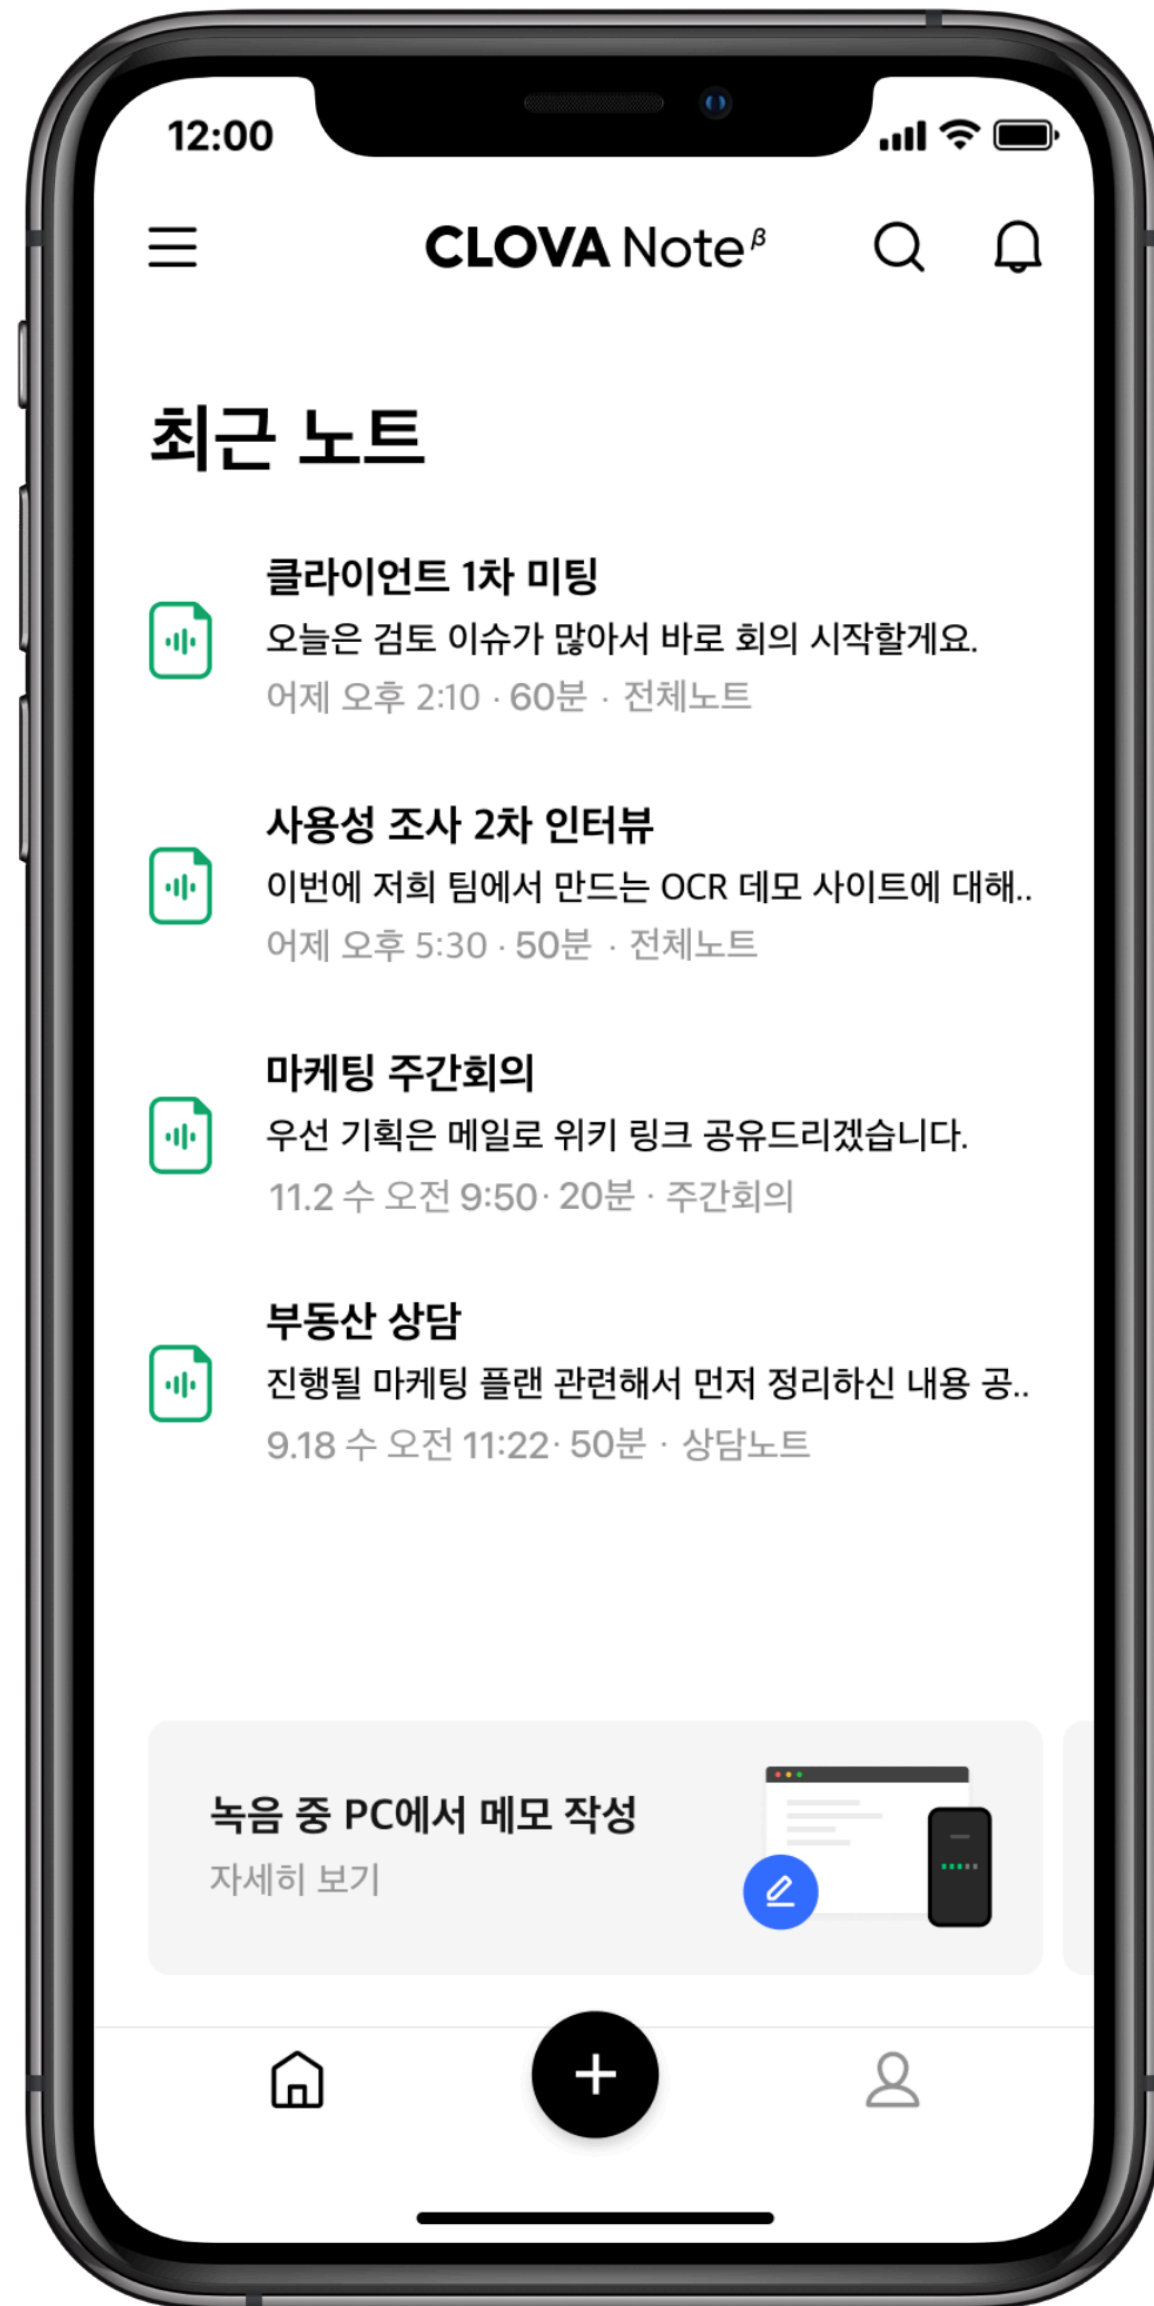

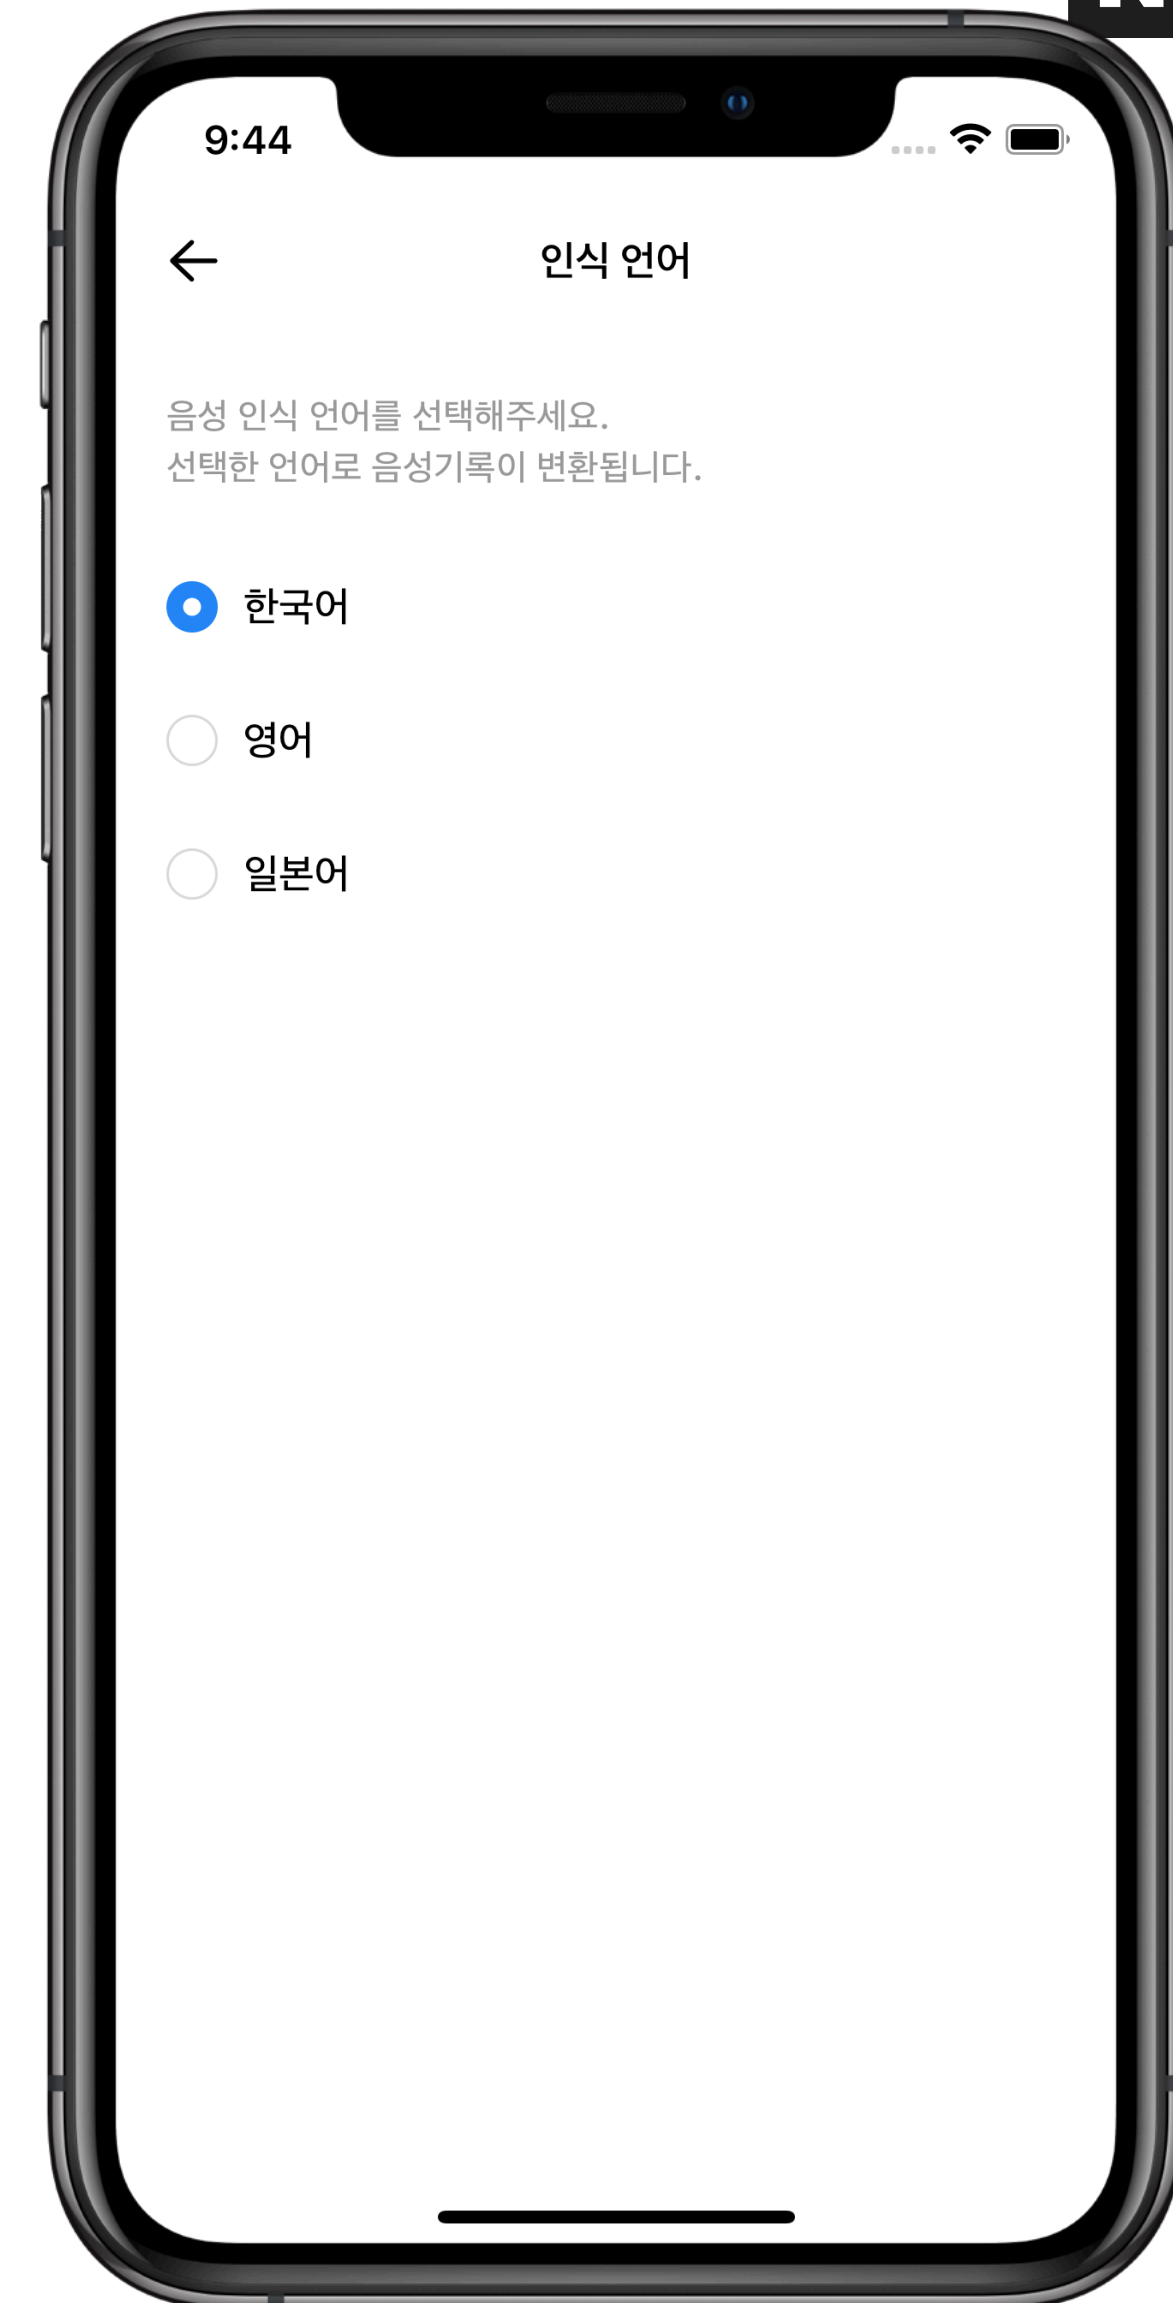

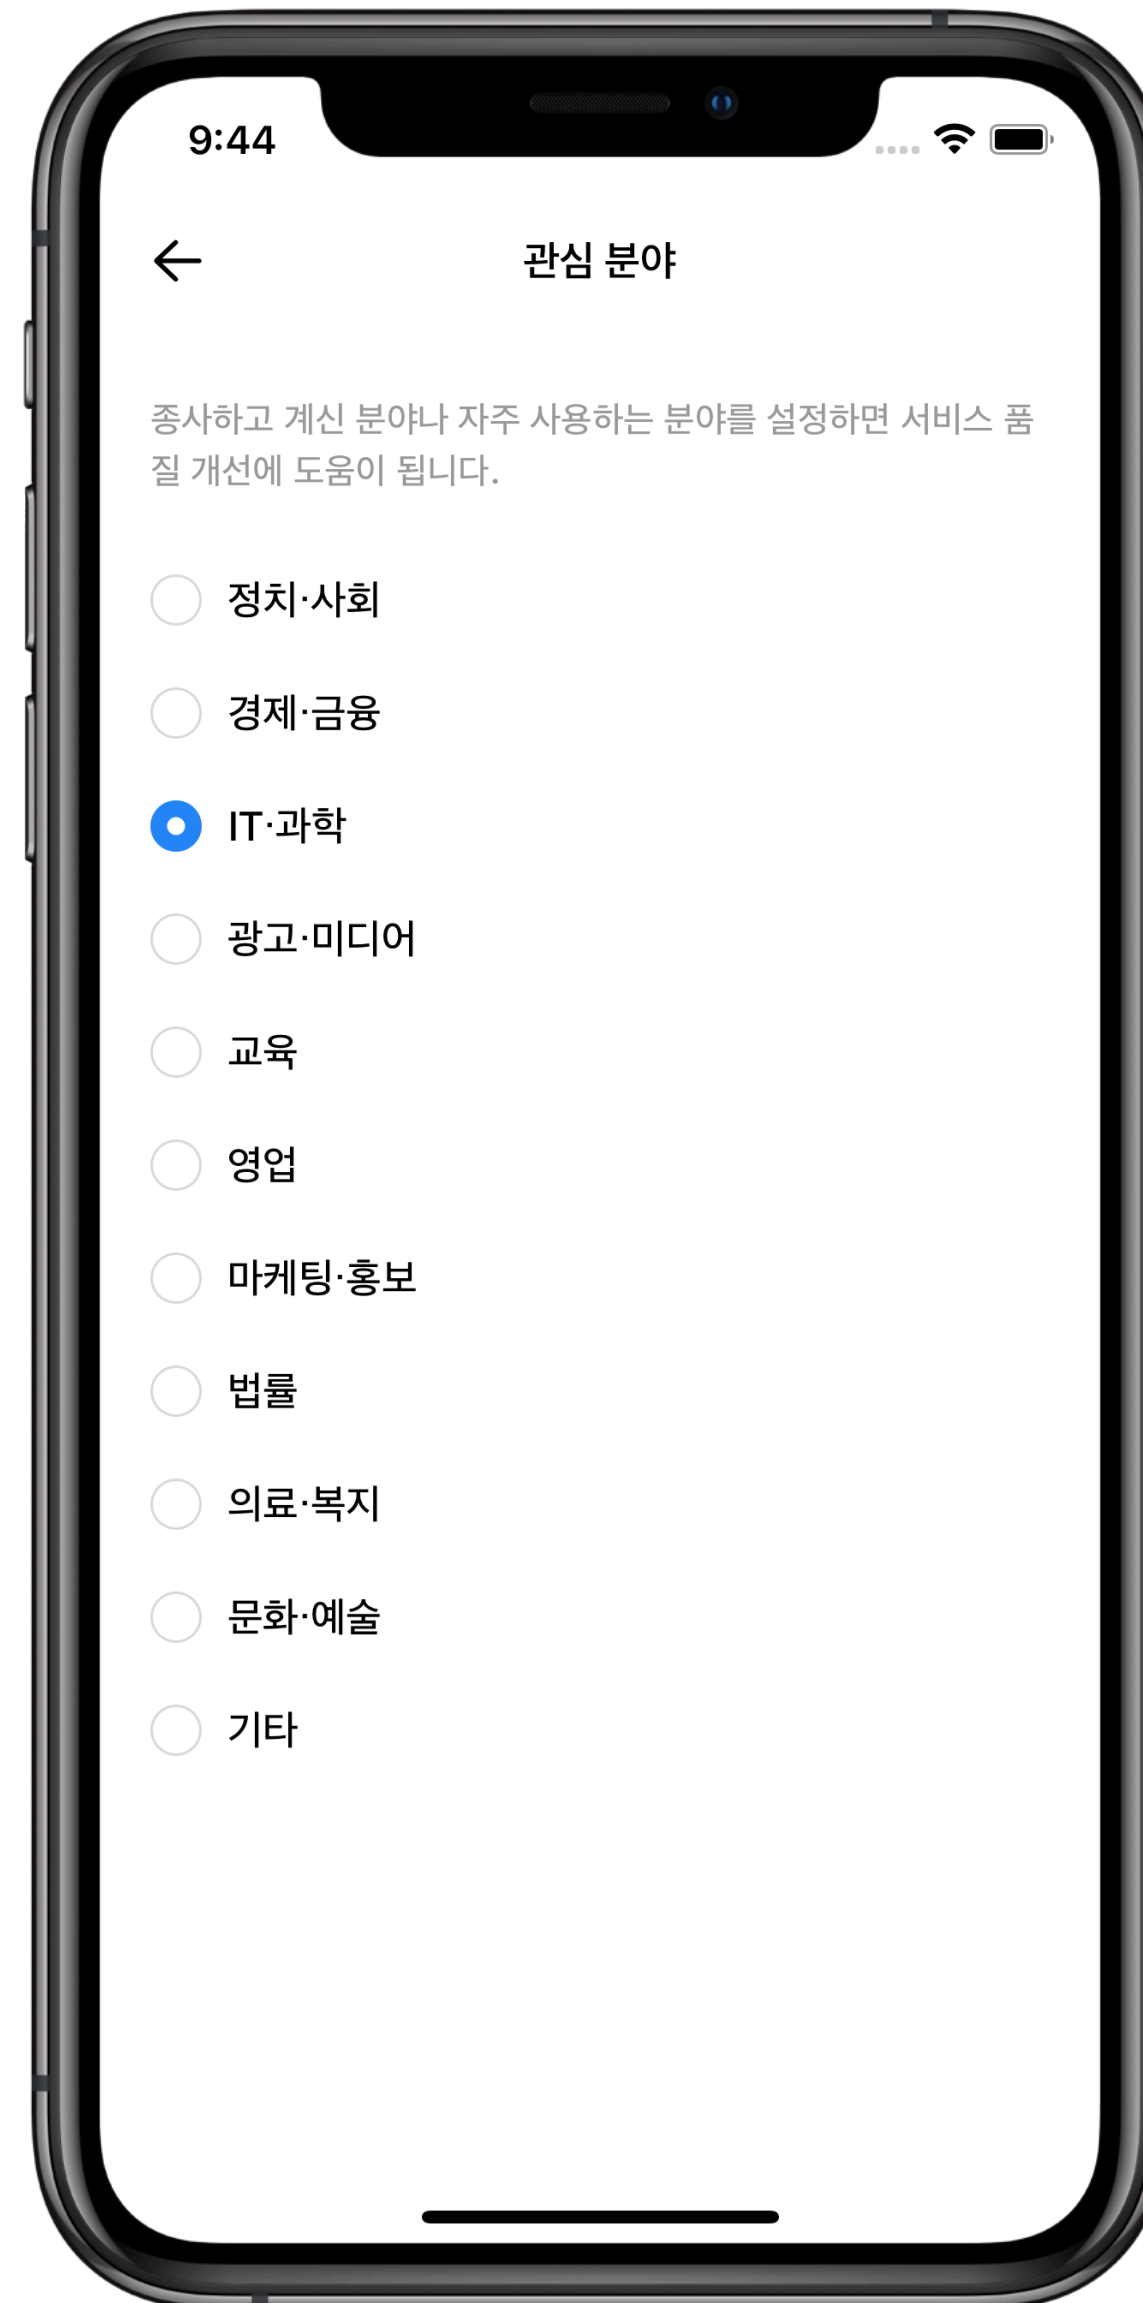

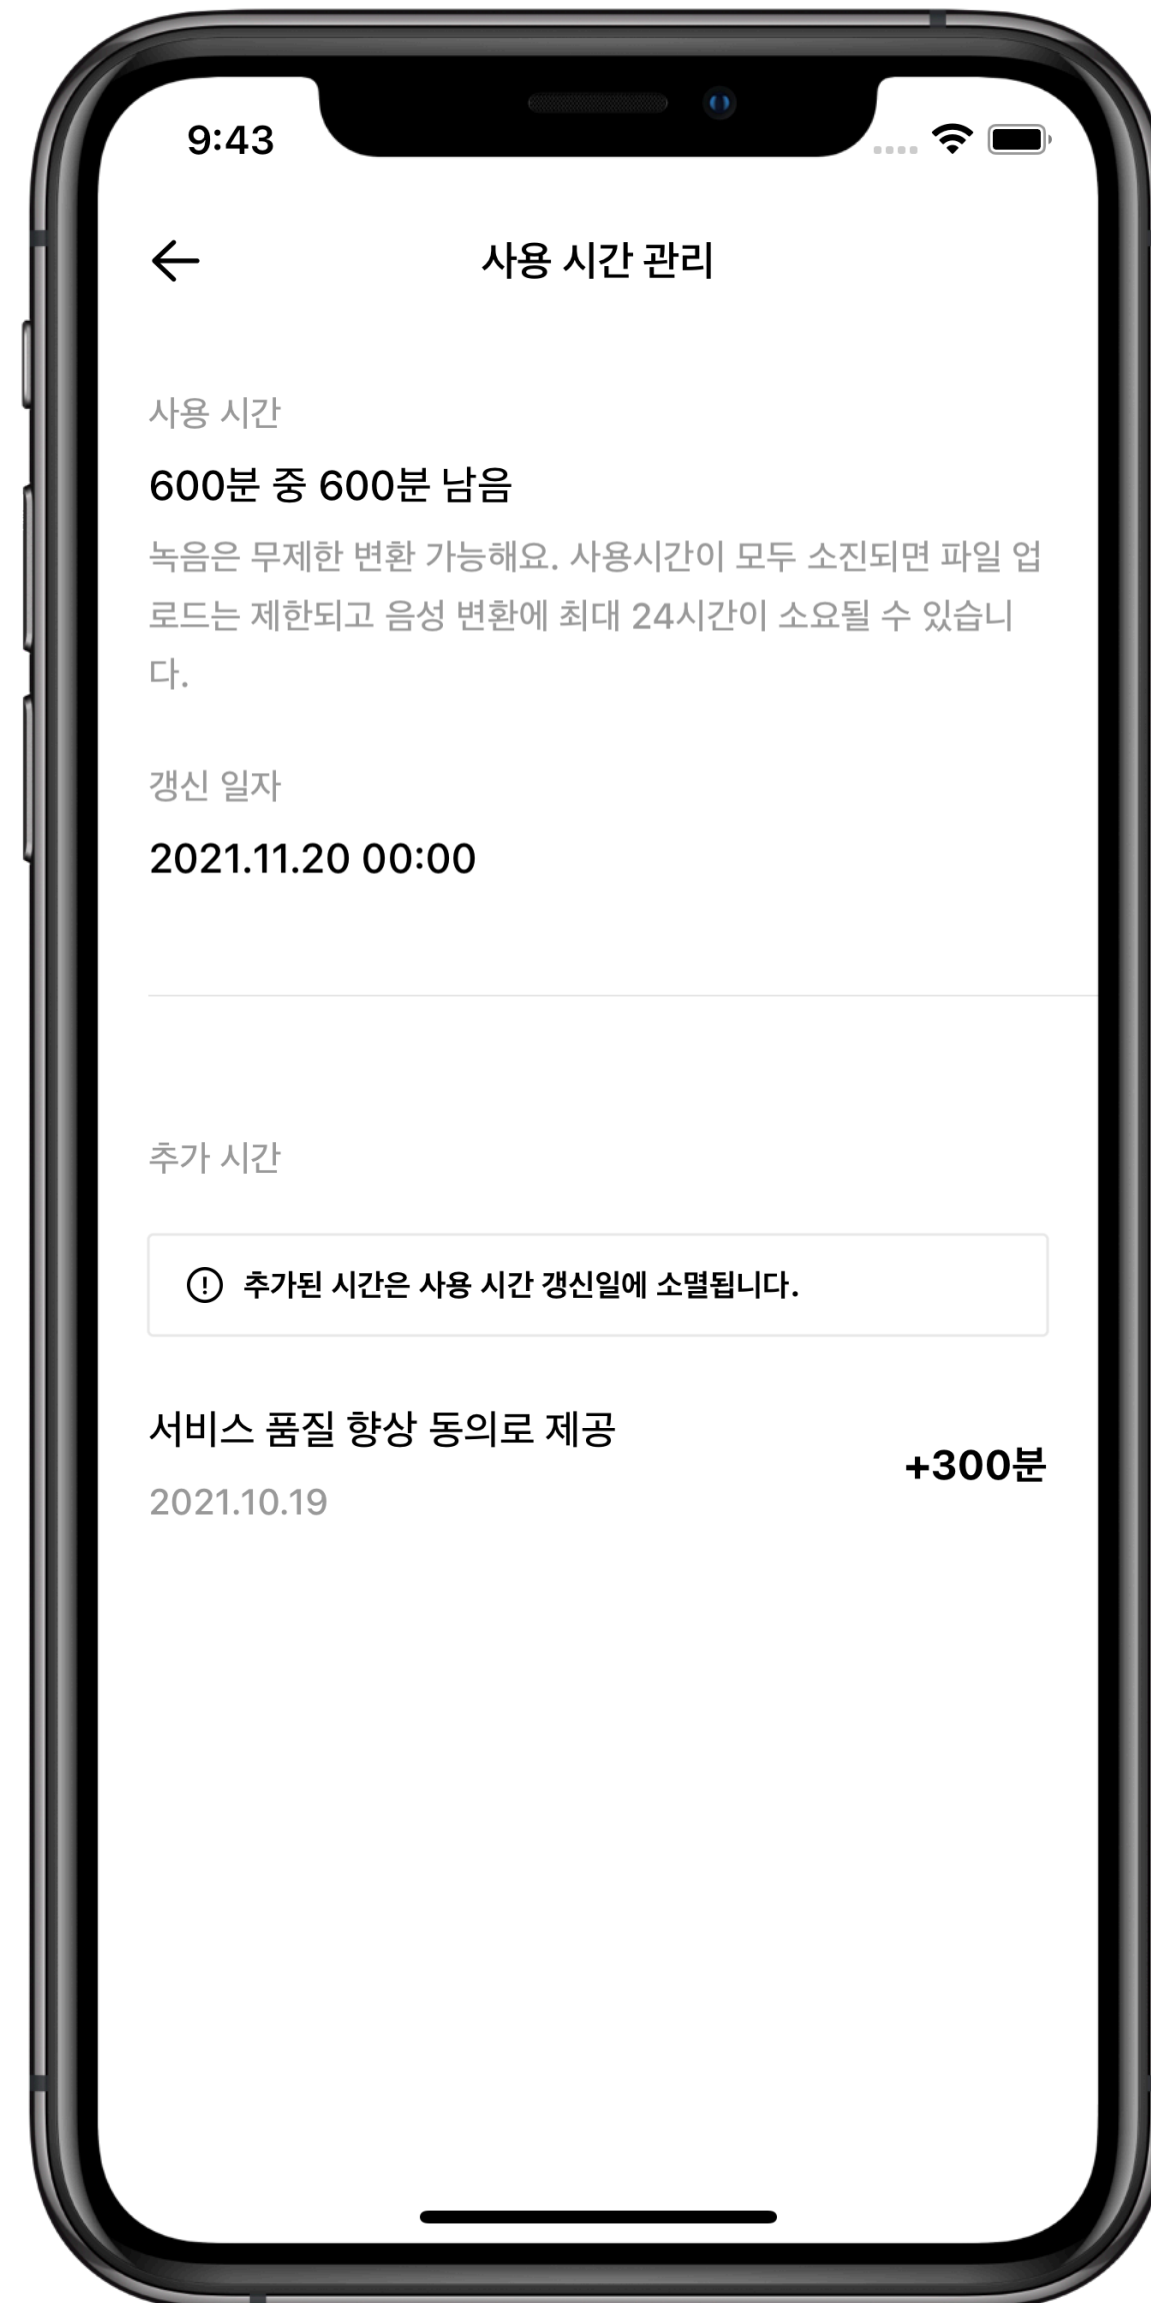

```
var body: some View {  
    List {  
        ForEach(viewModel.items) { item in  
            NotificationSettingItemView(title: item.title,  
                                        description: item.description,  
                                        isOn: .constant(true))  
        }  
    }  
}
```

Preview

```
struct NotificationSettingsView_Previews: PreviewProvider {  
  
    static var previews: some View {  
        NotificationSettingsView(viewModel: .init())  
            .previewLayout(.fixed(width: 375, height: 400))  
    }  
}
```

Declarative Syntax

Mix with UIKit (UIViewRepresentable)

UIKit View Hierarchy (UIHostingController)
